PROJECT CONSORTIUM MEMBERS

The project consortium is composed of the following companies:

- PricewaterhouseCoopers Société coopérative – is the largest professional services firm in Luxembourg with over 2100 people employed from 57 different countries. It provides audit, tax and advisory services including management consulting, transaction, financing and regulatory advice to a wide variety of clients from local and middle market entrepreneurs to large multinational companies.
- CARSA – is a leading Spanish research, innovation and technology consultancy, with 25 years of experience in managing projects, carrying out studies for public authorities, evaluating research funding programmes, and performing other research and innovation activities, with a focus on SMEs.
- The University of Manchester, Manchester Institute of Innovation Research – is a research centre in the Manchester Business School at the University of Manchester. Research and lecturing staff in the Institute focus on technology, innovation management, science, technology and innovation policy, technology foresight, and the evaluation of research and related topics.
- INNOVA SpA – is a research, innovation and technology consultancy with a presence in 8 countries, including the United States, that is a European major player in management & innovation consulting and technology transfer and valorisation, seed capital support and applied research lab facilities.
- London Economics – is a leading UK consultancy, specialising in economics and policy analysis, with expertise in analysis of applied economics in all areas where it can provide a powerful set of tools for decision-makers.
- DIW Berlin (German Institute for Economic Research) – is the leading German think tank for applied economic research and policy advice. Headquartered in Berlin since its founding in 1925, DIW Berlin currently employs about 100 scientific staff.
- DIW econ – is the economic consulting company of DIW Berlin, with a clear focus on the business needs of clients, whose work is based on the combination of sound economic theory with advanced economic tools and real data.

EXECUTIVE SUMMARY

Background

There can be no doubt that Small and Medium-sized Enterprises (SMEs) have had to navigate a difficult economic terrain in recent years. This Annual Report on the economic performance of European SMEs, now in its fifth year, is a testament to those challenges – but also a window to the progress achieved by businesses across the EU28 in spite of these challenging economic conditions. It is also a reflection of the structural support channelled to SMEs by the European Commission and National Governments under the guise of the Small Business Act (SBA).

Adopted in 2008, the SBA reflects the importance and centrality of SMEs to the European economy. It could have not come at a more critical time. SMEs were in some ways a bulwark against the devastating effects of the global financial crisis. They weathered the 2009 economic downturn more resiliently than their large enterprise counterparts and mitigated the economy-wide decline in employment.

SMEs were a bulwark against the devastating effects of the global financial crisis

Yet once the darkest days of the economic crisis were overcome, it was the large businesses that since 2010 to lead the recovery, fuelled mainly by strong growth in gross value added.

The recovery of SMEs was much slower and its pace has slowed in the last three years, mirroring to a large extent the pace of the recovery of large enterprises during that period.

Now, after promising signs last year, SMEs are at a critical juncture. While there are some reasons for cautious optimism, the inescapable conclusion is that conditions remain extremely tough for SMEs and further support is needed to yield sustainable SME growth.

A closer look at 2013

99 out of every 100 businesses in this sector are SMEs, as are 2 in every 3 employees and 58 cents in every euro of value added

Across the EU28 last year, some 21.6 million SMEs in the non-financial business sector employed 88.8 million people and generated €3,666 trillion in value added. Expressed another way, 99 out of every 100 businesses are SMEs, as are 2 in every 3 employees and 58 cents in every euro of value added. This illustrates how critical SMEs are and reflects the value of the present report.

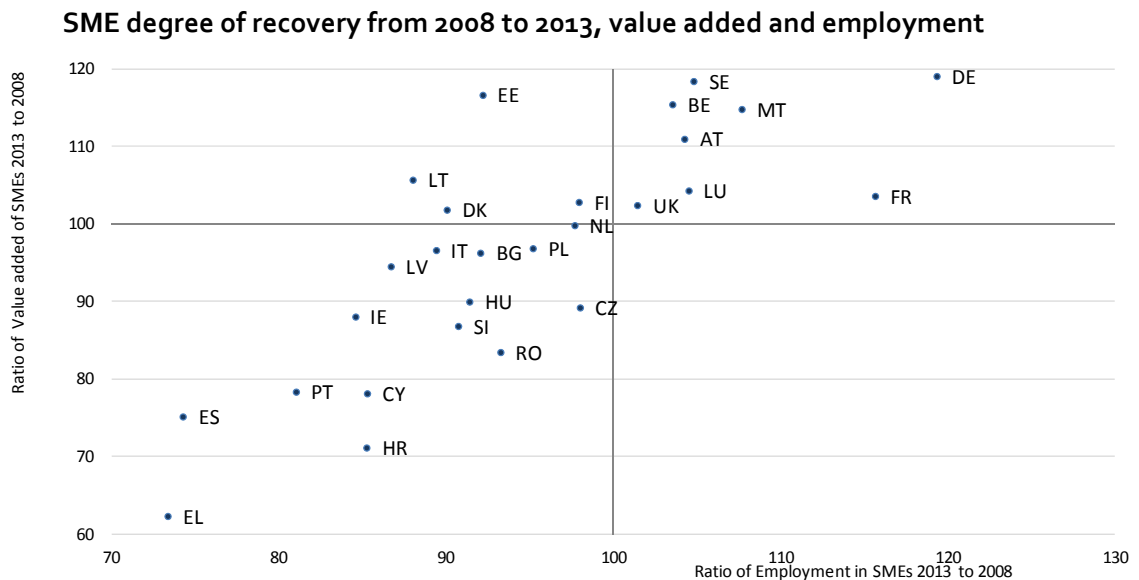

The level of value added generated by these SMEs increased overall by 1.1% in 2013. However this positive trajectory is tempered by two ancillary points: firstly, a slowdown in this increase from the two previous years, when it was 1.5% (2012) and 4.2% (2011); and secondly a decline in 2013 in both the total number of SMEs (-0.9%) and the number of people employed by SMEs (-0.5%).

All three performance indicators – value added, total number and employment – are inextricably linked and depend on each other to varying degrees.

The slowdown in value added growth by SMEs can be attributed to weak, if positive, economic growth and falling inflation within the EU economy. Only when the EU economy, on a macro scale, will emerge from recession into recovery, one can expect that the fortunes of SMEs will improve accordingly.

Since 2008, SMEs have fared very differently across countries, size class and sectors and clear fracture lines have emerged.

For example, a full value added and employment recovery has only been achieved by SMEs in only eight countries – including Europe's largest economy Germany while SME value added and employment in 15 countries have not yet recovered to their 2008 levels:

Note: Due to a break in the data series, Slovakia is not included in the figure above

A similar break line is observable across SME sectors.

The most important SME sectors are “wholesale and retail trade sector”, the largest SME sector in all Member States, “manufacturing”, “construction”, “professional, scientific and technical activities”, and “accommodation and food”. Together, these 5 sectors account for almost 4/5 of all SMEs in the EU28.

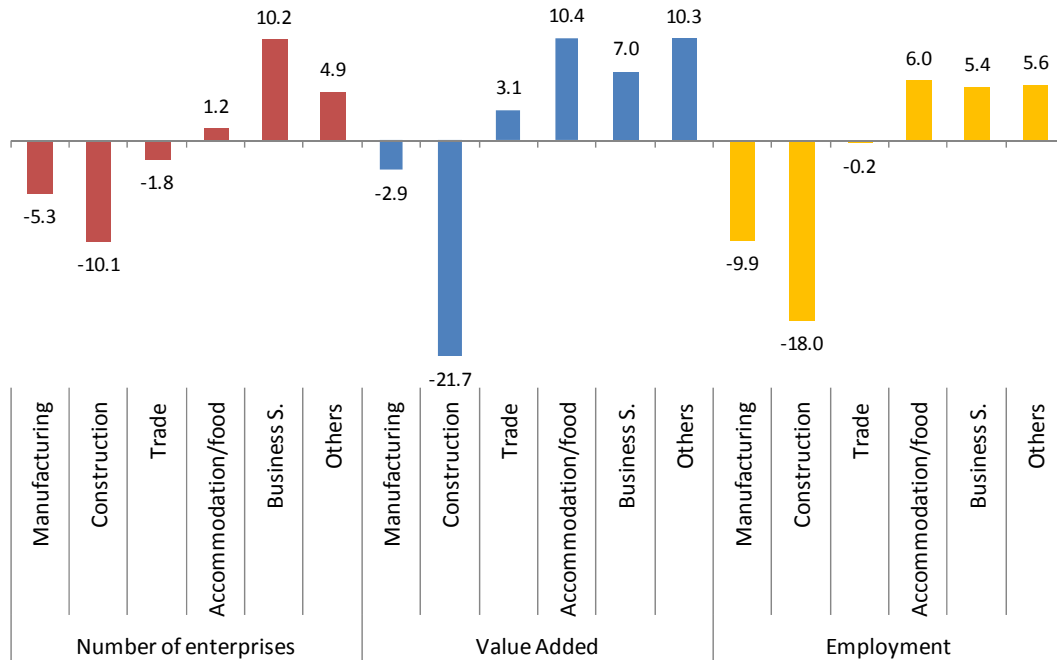

These five sectors have fared very differently since 2008.

Some SME sectors has posted relative strong positive growth from 2008 to 2013 with “business services”, “retail and wholesale trade” and “other sectors” (which include all other non-financial business sectors) posting positive value added growth.

In contrast, the construction industry has suffered severely, with an almost -22% cumulative decline in value added from 2008 to 2013. It has also registered an 18% decrease in the level of employment and the number of enterprises is 10% lower.

The manufacturing sector also continued to operate in 2013 well below 2008 levels, with employment in 2013 still 10% below its 2008 level.

Change (in %) in three SME indicators from 2008 to 2013 in the EU28– key SME sectors

The level of recovery is also quite varied SMEs of different size: while there are more micro firms than there were in 2008 (+0.3%), small and medium firms are respectively 1.6% and 2.5% less numerous than they were before the crisis.

The recovery in value added is for the most part driven by medium enterprises (+2.7%) and micro firms (+0.5%), while small firms are still lagging behind with value added in 2013 just below its 2008 levels. In terms of employment, all groups of SME firms are in 2013 still well below 2008, with micro firms employing 4.2% fewer people.

Internationalisation of SMEs

It is important to note that while the prospects for SME success are tied with macro-economic developments, they by no means identically mirror all of them. As the majority of SMEs operate in sectors that serve domestic demand, for example, they did not share in the benefits of increased foreign demand, which was the key macro-economic driver of growth from 2008 to 2013.

Many SMEs are not in export-oriented sectors, particularly the micro and small enterprises.

Thus, programmes supporting SME exports benefit directly only a sub-set of SMEs. However, indirectly, all SMEs benefit to some extent from growth in exports as higher exports raises a) overall income levels, and hence the demand for goods and services sold by domestic demand facing SMEs, and b) the demand for goods and services originating from exporting-oriented enterprises.

Yet in an increasingly internationalised world, there are competitive advantages for those businesses that begin with a global strategy and can move quickly to take advantage of cross-border activities. Providing further, tailored support for this growing asset class would form a key step in allowing SMEs to leverage the benefits of increased foreign demand for goods and services.

The road ahead

Looking ahead, there is a positive outlook and the promise of a strengthening of the recovery on the horizon. Total value added generated by SMEs has already surpassed its pre-crisis level and is now expected to rise by 2.8% in 2014 and 3.4% in 2015. Employment is also expected to rise, with another 740,000 jobs in SMEs, as is the total number of SMEs (+0.38%), by 2015.

There is a positive outlook and the promise of a strengthening of the recovery on the horizon

Improvements in EU SME's performance depend critically on the further evolution of the macro-economic recovery. However, specific measures for improving the SMEs business environment play an important enabling role to ensure that SMEs are able to reap the full benefits of a return to solid and sustainable macroeconomic growth.

At the centre of this is the continued work on the Small Business Act's (SBA) five foundations: responsive administration, access to finance, access to markets/internationalisation, entrepreneurship, and skills & innovation. Policy implications here would range from reducing administrative costs and elevating SMEs' status as a political priority through national SBA strategies, to supporting the establishment of an SME stock market exchange, assisting with the digitisation of SME practices such as e-payments, and advocating the mandatory inclusion of entrepreneurship education in national school curricula and public universities.

1 INTRODUCTION

Small and Medium-sized Enterprises (SMEs) form the backbone of a country's economy. Across the EU28, there were 21.2 million SMEs in the non-financial business sector¹ in 2013. SMEs account for 99.8% of all enterprises in this particular sector, 66.8% of total employment and 57.9% of total value added generated by the non-financial business sector.

SMEs accounted for 99.8% of all enterprises in the non-financial business sector in 2013

SMEs are defined as businesses which employ less than 250 staff and have an annual turnover of less than €50 million and / or their balance sheet total is less than €43 million.² They comprise three categories – micro, small and medium – which are defined as follows.

Table 1: Definition of SMEs

Company category	Employees	Turnover	or	Balance sheet total
Micro	<10	< € 2 million		< €2 million
Small	<50	< €10 million		< € 10 million
Medium	<250	< €50 million		< €43million

Note: The size-class definition adopted throughout the report is based on the definitions used in the Structural Business Statistics (SBS) database maintained by Eurostat. It relates to the number of persons employed.

The present report on the state of European SMEs published by EC DG Enterprise and Industry is an integral part of the annual SME Performance Review.

1.1 SME Performance Review

The SME Performance Review, conducted on an annual basis, is one of the main tools the European Commission uses to monitor and assess countries' progress in implementing the Small Business Act (SBA).

The SBA strives to foster SME development and remove obstacles to SME growth. It does not constitute a legal requirement, but a series of guidance measures that can be

idiosyncratically adapted to suit each country's specific needs while simultaneously achieving a degree of harmonisation across the EU. The ten principles are:

1. **Entrepreneurship:** Creating an environment in which entrepreneurs and family businesses can thrive and entrepreneurship is rewarded.
2. **Second Chance:** Ensuring that honest entrepreneurs who have experienced bankruptcy are promptly given a second opportunity to succeed.
3. **Think Small First:** Designing rules modelled on the "Think Small First" principle.³
4. **Responsive Administration:** Making public administrations responsive to the needs of SMEs.
5. **State Aid and Public Procurement:** Adapting public policy tools to suit SME needs - facilitating SMEs' participation in public procurement and ensuring better access to State Aid for SMEs.
6. **Access to Finance:** Facilitating SMEs' access to finance and developing a legal and business environment conducive to the specific requirements of SMEs, including timely payments in commercial transactions.
7. **Single Market:** Helping SMEs to benefit more from the opportunities offered by the Single Market.
8. **Skills and Innovation:** Promoting the enhancement of skills in the SME workforce and all forms of innovation.
9. **Environment:** Enabling SMEs to transform environmental challenges into economic opportunities while acting sustainably.
10. **Internationalisation:** Encouraging SMEs to benefit from the growth of global markets and supporting them in this pursuit.

The SME Performance Review brings together comprehensive information on the policy activity to implement the SBA and the economic performance of SMEs in EU28 Member States, as well as 9 other partner countries.⁴ The main outputs of the review process are the present Annual Report on European SMEs, the Summary Paper on the SBA implementation, the SME policy database and the SBA country fact sheets.

1.2 Scope and objectives of the report

The report consists of four chapters that aim to collectively illustrate the SME landscape, highlight the factors behind SME performance, consider the increasing globalisation of SMEs, and set out recommendations for further improvements in the sector.

Chapter 1 begins by introducing the report and contextualising the Performance Review.

Chapter 2 considers the state of the SME sector in 2013; the performance of SMEs in 2013 and over the period 2008 to 2013; the business environment that SMEs are currently facing in the EU, and the outlook for SMEs in 2014 and 2015.

Chapter 3 analyses a number of factors explaining differences in SME performance across Member States and economic sectors. The chapter focuses in particular on the macro-economic environment, the internationalisation of SMEs and the development of the SME sector in high-tech manufacturing and knowledge intensive services.

Finally, chapter 4 highlights a few key conclusions and puts forward a list of recommendations. These are designed to improve structural support for SMEs and enhance their prospects for success.

2 THE RECENT PERFORMANCE OF SMES AND THE OUTLOOK FOR 2014 AND 2015

Three key performance indicators are used in the report: the number of SMES, the value added (in current prices⁵) generated by SMES and the number of persons employed by the SMES. Some of the main factors explaining differences in the performance of the SME sector across the EU28 are discussed in chapter 3.

Key SME performance indicators:

- The number of SMES
- The value added they generate
- The number of people they employ

The first section presents a broad snapshot of SMES in the non-financial business sector in the EU28 in 2013, and reviews post-2008 trends.

The second section highlights some aspects of the business environment in which the SMES operate in the EU28, while the third section describes the outlook for SMES in 2014 and 2015.

Finally, the fourth section reviews recent SME trends in the candidate countries, the USA, Japan and the BRICS.

2.1 Recent performance of SMEs in the EU

KEY FINDINGS

- SMEs are integral to job growth, employing 88.8 million people in 2013 in the EU28
- €3,666 trillion in value added generated by SMEs in 2013 in the EU28 (28% of EU28 GDP)
- Non-financial business sector dominated by SMEs in terms of number of enterprises
- Difficult economic conditions for SMEs overall:
 - SME value added in 2013 was just 1% above 2008 levels in the EU28
 - Employment in 2013 still 2.6% below levels registered in 2008 in the EU28
- The performance of SMEs varies considerably among size classes, sectors and Member States
 - Micro SMEs suffered biggest decline in total number and number of employees between 2008 and 2013 in the EU28
 - Construction and manufacturing value added in 2013 still below 2008 levels (-21.7%, -2.9%) in the EU28
 - SMEs sectors in only a limited number of Member States have exceeded in 2013 their 2008 pre-crisis performance

2.1.1 SMEs in the EU28 in 2013

21.6 million SMEs employed 88.8 million people⁶ and generated €3,666 trillion in value added⁷ in the non-financial business sector in 2013 in the EU28. This is equivalent to 28% of EU28 GDP.

88.8 million

Number of people employed by SMEs

Overall, SMEs accounted for 99.8% of all enterprises active in the EU28 non-financial business sector, 66.8% of total employment and 58.1% of the value added (Table 2).

€3,666 trillion

Amount of value added generated by SMEs (equivalent to 28% of EU GDP)

Micro-enterprises accounted for 92.4% of all enterprises in the EU28 non-financial business sector.

However, the distribution of employment and value added across the three groups of SMEs was more equal, with micro, small and medium enterprises accounting for 43%, 31% and 26% of EU28 SME

employment, respectively, and 37%, 31% and 32% of value added generated by SMEs in the EU28 non-financial business sector.

Table 2: SMEs and large enterprises: number of enterprises, value added and employment in the EU28 in 2013

	Micro	Small	Medium	SMEs	Large	Total
Number of enterprises						
Number	19,969,338	1,378,374	223,648	21,571,360	43,517	21,614,908
%	92.4%	6.4%	1.0%	99.8%	0.2%	100%
Employment						
Number	38,629,012	27,353,660	22,860,792	88,843,464	44,053,576	132,897,040
%	29.1%	20.6%	17.2%	66.9%	33.1%	100%
Value added at factor costs						
Million Euros	1,362,336	1,147,885	1,156,558	3,666,779	2,643,795	6,310,557
%	21.6%	18.2%	18.3%	58.1%	41.9%	100%

Source: Eurostat, National Statistical Offices and DIW Econ

In the non-financial business sector in the EU28, the six largest Member States (France, Germany, Italy, Poland, Spain and United Kingdom) account for almost:

- 66% of all SMEs (Figure 54, Annex I);
- 74% of value added generated by SMEs (Figure 55, Annex I);
- 69% of total SME employment (Figure 56, Annex I).

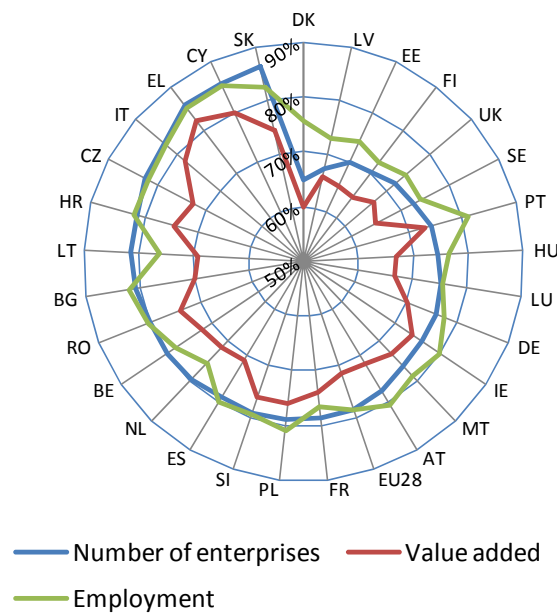

The share of the micro SMEs in the total number of SME enterprises ranges from 82% in Germany to 96% in the Czech Republic, Greece, and Slovakia (see annex III of the statistical background document for detailed information).

Five key economic sectors account for approximately 78% of all SMEs in the EU28: "manufacturing", "construction", "professional, scientific and technical activities", "accommodation and food" and "wholesale and retail trade, repair of motor vehicles and motorcycles"⁸ (Figure 1).

The same five sectors also account for roughly 71% of the value added created by SMEs in the EU28 and for 79% of total EU28 SME employment (Figure 1).

Five key sectors account for at least 65% of the SME activity in all Member States - and play an even bigger role in Italy, Czech Republic, Poland, Slovakia, Slovenia and Romania

Figure 1: Importance of the five key sectors in the SME sector in Member States -2013

Note: Share of SME enterprises in total SME population, share of valued added generated by SME population and share of total employment by SME population. Five key sectors include "manufacturing", "construction", "accommodation and food services", "professional, scientific and technical activities", and "wholesale and retail trade, repair of motor vehicles and motorcycles".

Source: Eurostat, National Statistical Offices and DIW Econ

The retail sector is the most dominant across the EU

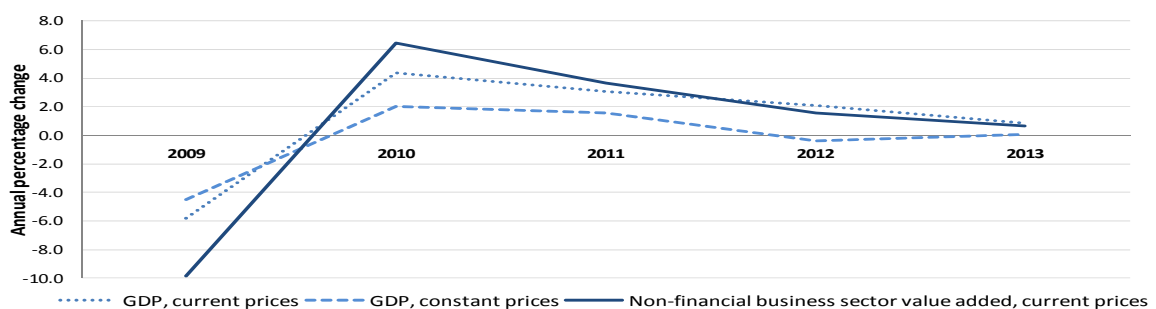

Among the five key sectors, the retail/wholesale sector is the largest in almost all EU Member States (Figure 58, Annex I).

2.1.2 Performance in 2013 of SMEs in the EU28 non-financial business sector

Broad macroeconomic conditions in 2013

Even though overall economic conditions improved marginally in 2013, the overall macro-economic environment continues to be very challenging for SMEs (Figure 2).

Figure 2: Evolution of EU28 GDP and EU28 value added of non-financial business sector (annual percentage change)

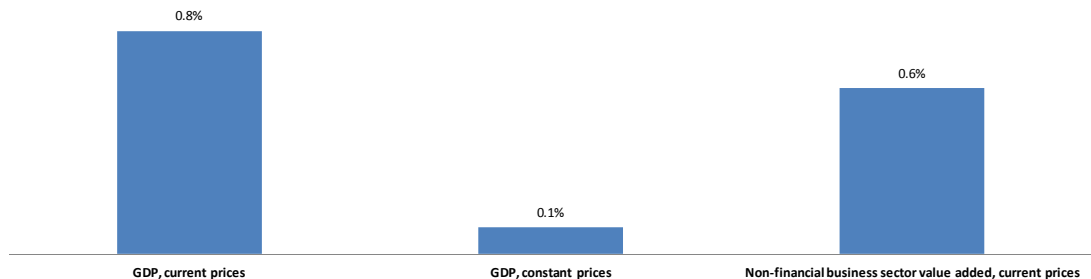

Note: Slovakia is not included in the value added aggregate due to a break in the series.

Source: Eurostat, National Statistical Offices, DIW Econ

Of particular importance for SMEs is the fact that economy-wide growth in 2013 was very subdued (Figure 3).

Figure 3: Change (in %) in EU28 GDP and EU28 value added of non-financial business sector from 2012 to 2013

Note: Slovakia is not included in the EU value added aggregate due to a break in the series. GDP at constant prices is in chain-linked volumes

Source: Eurostat, National Statistical Offices, DIW econ

Performance of the EU28 SME sector in 2013

SMEs in the non-financial business sector in 2013:

The rate of expansion of the value added generated by SMEs in the EU28 non-financial business sector slowed again in 2013, falling to 1.1% in 2013 from 1.5% in 2012 and 4.2% in 2011 (Figure 4 and Table 12, Annex II).

This slowdown in growth reflects a combination of positive but weak economic growth and falling inflation in the EU economy more generally.

In contrast, both the number of SME enterprises and SME employment in the non-financial business sector fell respectively by 0.9% and 0.5% in 2013 after having already recorded a decline in 2012.

▲ +1.1%

Employment

Figure 4: Number of SMEs in the non-financial business sector, value added generated by these SMEs and number of persons employed by these SMEs - EU28, 2008 to 2013 (2008=100)

Note: Slovakia is not included in this EU aggregate due to a break in the series.

Source: Eurostat, National Statistical Offices, DIW Econ

Performance of SMEs in 2013 by size class

At the level of the EU28, micro SMEs posted an increase in value added that was almost twice as large as small and medium-sized SMEs in 2013 (1.5% for micro SMEs versus 0.7% and 0.9% for small and medium sized SMEs) (Figure 5).

However, micro SMEs fared somewhat less well than small and medium-sized SMEs in terms of number and jobs:

- The number of micro SMEs fell by 0.9% in 2013 while that of small and medium-sized SMEs declined only very marginally (-0.4% and -0.4% respectively);
- Mirroring the drop in the number of micro SMEs, EU28 employment by micro SME dropped by 1% while employment at small and medium-sized SMEs remained practically unchanged.

Micro SMEs performed better than small and medium SMEs in terms of valued added – but less well in terms of number of enterprises and employment

Figure 5: Annual growth (in %) in different performance indicators by SME size - EU28

Note: Slovakia is not included in this EU aggregate due to a break in the series.
Source: National Statistical Offices, Eurostat, DIW econ

However, even if the performance of micro SMEs and other SMEs differed somewhat in 2013, the composition by class size of the SME in the EU28 non-financial business sector has barely changed overall from 2008 to 2013 (Table 13, Annex II).

Performance of SMEs in 2013 by Member State

Between 2012 and 2013, only a limited number of Member States registered positive trends in two or three performance indicators (Table 14, Annex III):

- SMEs in the non-financial business sector in Lithuania, Latvia, Malta, and Romania, posted a positive and strong performance in terms of number of firms, employment and value added, with gains higher than 3%;
- SMEs in Germany, Estonia, Denmark, Austria, Luxembourg and Sweden also shared this positive trend but with smaller growth rates (between 0.5% and 3%);
- In a group of four other countries (the United Kingdom, Ireland, Hungary and the Czech Republic), growth of value added generated by SMEs in the non-financial business sector was sluggish (or stable, ranging between -0.05% and 0.05%) and employment and number of enterprises grew;
- SMEs in the Netherlands, Finland, Greece, and Cyprus posted a negative performance in all three indicators under scrutiny, with growth rates between -0.05% and -3% in the former two countries, and below -3% for the latter. Croatia also falls in this group in terms of employment and value added growth but not in terms of number of enterprises;
- Finally, SMEs in the non-financial business sector in Belgium, Italy, Poland, Slovakia, France, Spain and Slovenia posted moderate growth in value added (below 3%) and recorded declines in terms of number of SMEs or persons employed ranging between -0.05% and -3%.

Performance of SMEs in 2013 across sectors

In 2013, the number of SMEs and employment increased only in two sectors (Business Sectors and Others), while losses were observed in the other industries (particularly in Construction) (Table 3). The performance in terms of value added was relatively more positive, with the exception of the construction sector.

Table 3: Performance of SMEs by sector in the EU28 in 2013

	EU28 Number of SMEs % change 2012-2013	EU28 Value Added of SMEs % change 2012-2013	EU28 SME Employment % change 2012-2013
Manufacturing	-1%	1%	-1%

2.1.3 To what extent have the SMEs recovered from the economic crisis?

At the EU level, SMEs have recovered to pre-crisis levels only in terms of value added, and to a lesser extent, in terms of number of firms. Employment in 2013 was still 2.6% below levels registered in 2008.

Figure 6: Recovery of EU28 SMEs in 2013 relative to 2008 (% change in 2013 levels from 2008 levels)

Note: Slovakia is not included in this EU aggregate due to a break in the series.
Source: Eurostat, National Statistical Offices and DIW Econ

This overall picture hides considerable variations across Member States and industrial sectors. These differences are reviewed in greater detail below.

Of note is the fact that the relative importance of SMEs and large enterprises in the non-financial business sector is practically unchanged since 2008 (Figure 57, Annex I).⁹

Differences in SME recovery across Member States

Across the EU, SMEs in the large majority of Member States have not yet fully recovered from the recession and their performance in terms of number of enterprises, value added and employment in 2013 was still below 2008 levels (see summary and more detailed tables in Annex IV).

In fact, on the basis of value added, the following groups of countries can be distinguished:

- **The "front runner" group** comprises Austria, Belgium, Germany, Estonia, Malta, Sweden and Slovakia (although the latter's performance was also affected to a certain degree by a change in the national SME definition). In this group, the value added generated in 2013 by SMEs in the non-financial business sector exceeded by more than 10% the value added created in 2008.

The value added generated by SMEs in 2013 in AT, BE, DE, EE, SK and SE was 10% or more higher than in 2008.

In contrast, the value added generated in 2013 by SMEs in CY, CZ, EL, ES, HR, HU, IE, PT, RO and SI was still 10% or more lower than in 2008

However, among these strong performers, only German SMEs posted an employment level higher by 10% or more in 2013 than in 2008. SME employment in the other countries of this group was between 2% and 10%

higher with the exception of Estonia where SME employment was 8% lower in 2013 than in 2008;

- **The solid performer group** comprises Finland, France, Lithuania, Luxembourg and UK. In these countries, the level of value added generated by SMEs in the non-financial business sector was between 2% and 10% higher in 2013 than in 2008.

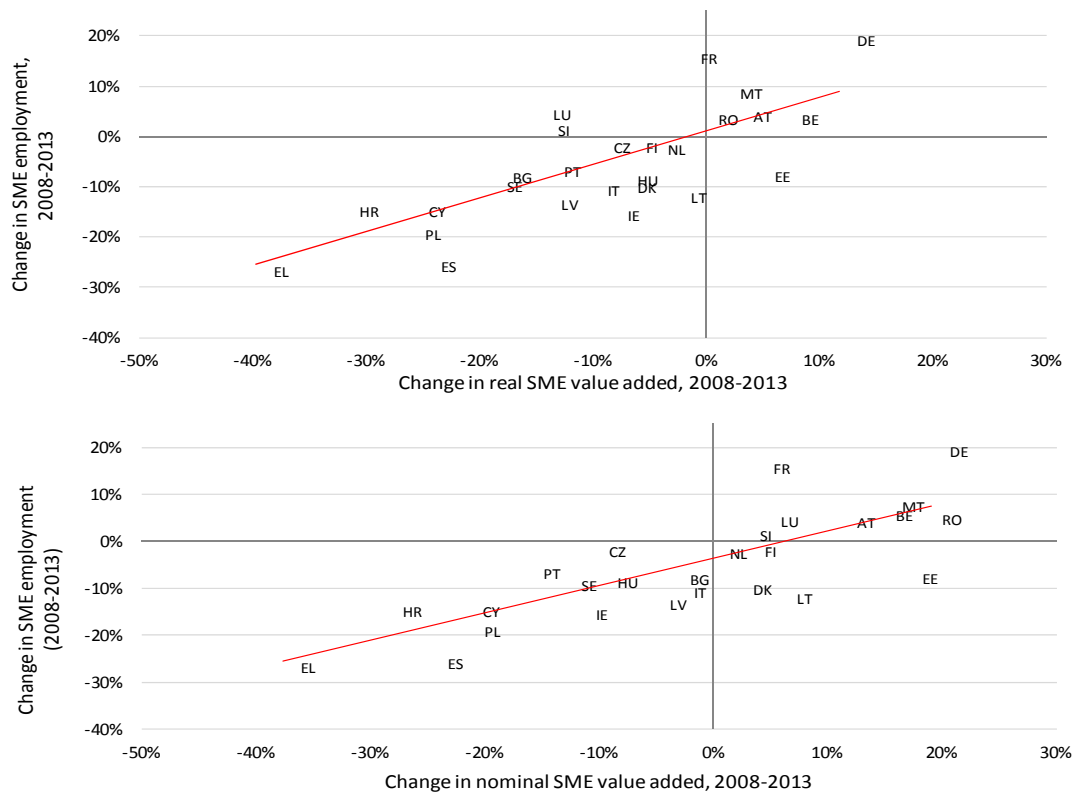

In contrast to the employment performance of the strong performer group, the employment performance of the solid performer group is much more mixed;

- In France, SME employment was 16% higher in 2013 than in 2008 reflecting strong growth in solo entrepreneurs over this period;
- In Luxembourg and the United Kingdom, SME employment in 2013 was 4% higher than in 2008;
- In Finland, the level of SME employment in 2013 was 3% lower than in 2008 and in Lithuania SME employment was down by 12% in 2013 relative to 2008.
- The **no change group** includes only the Netherlands. It is the only country in which aggregate SME performance in 2013 was very close to that of 2008. The level of SME value added in 2013 was 1% lower than in 2008 and employment was down by 2%.
- The **group of weak performers** includes Bulgaria, Denmark, Italy, Latvia and Poland. The level of value added generated by SMEs in the non-financial business sector in this group of countries was between 2% and 10% lower in 2013 than in 2008.
- SME employment in the weak performers mirrored the decline in value added. SMEs in Bulgaria and Poland posted employment levels that are respectively 8% and 5% lower in 2013 than in 2008 while in Denmark, Italy and Latvia 2013 SME employment levels are down by 10%, 11% and 13%.
- Finally, the group of **very weak performers** includes 10 countries: Croatia, Cyprus, Czech Republic, Hungary, Greece, Ireland, Portugal, Romania, Slovenia and Spain.
 - In this group of countries the level of value added generated in 2013 by SMEs in the non-financial business sector was 10% (or more) lower than in 2008. The largest declines in SME value are observed in Romania (-17%), Greece (-38%) and Cyprus (-22%).
 - In all these countries, except the Czech Republic, Romania and Slovenia, SME employment in 2013 was 10% (or more) lower than in 2008. In Romania and Slovenia employment was respectively down by 7% and 9% in 2013 relative to 2008 while in the Czech Republic employment was down by only 2%.

On average there is a relatively strong relationship between changes in the value added produced by SMEs and SME employment (Figure 7). The correlation between the percentage change from 2008 to 2013 in value added (at current prices) and employment over the same period is 0.79.

Adjusting value added for inflation has practically no impact on the estimated correlation, as the value of the correlation coefficient is 0.74.

Figure 7: Relationship between changes (in %) from 2008 to 2013 in EU28 SME value added (at current and constant prices) and EU28 SME employment

Source: Eurostat, National Statistical Offices, Eurostat, DIW Econ

Differences in SME recovery across sectors

The EU28 **construction** SME sector, which accounts for 11% of SME value added and 12% of SME jobs, suffered a severe cumulative decline from 2008 to 2013 with the level of value added in 2013 being 21.7% lower than in 2008, the level of employment 18% lower and the number of enterprises 10.1% lower (Figure 8).

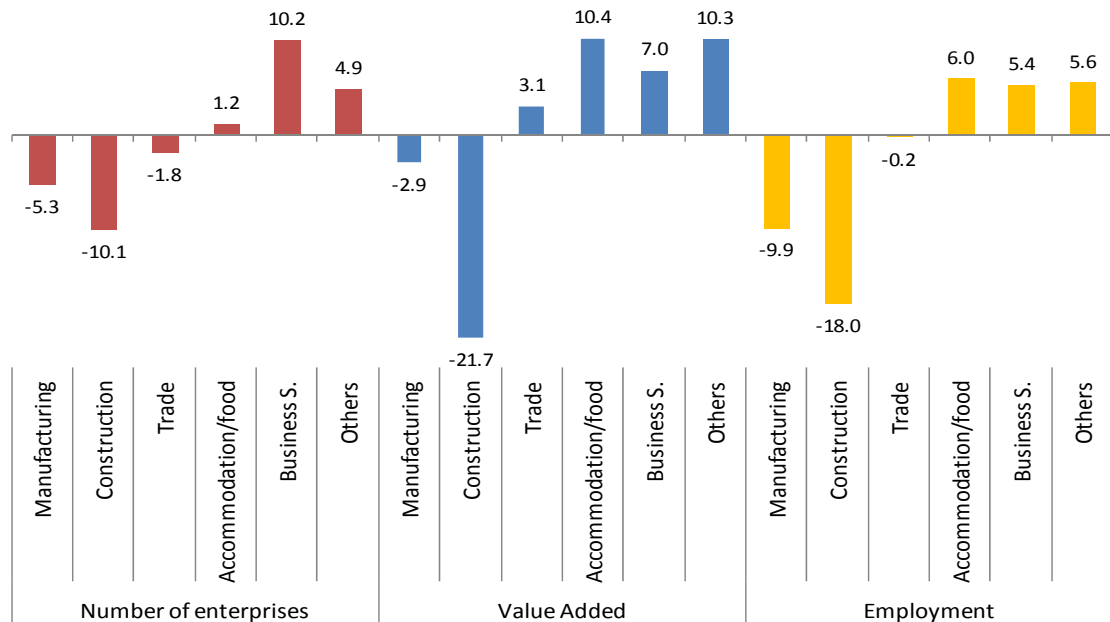

The EU28 **manufacturing SME sector** is also still operating at well below 2008 levels with value added down by 2.9% in 2013 relative to 2008, the level of employment down by 9.9% and the number of enterprises down by 5.3%. Today, this sector employs more than 17 million individuals and generates 21% of SME value added in Europe.

The **value added** of the EU28 **retail and wholesale** SME sector increased by 3.1% while employment and the number of enterprises is broadly flat over the 2008 to 2013 period; this industry alone employs 26% of the SME labour force and accounts for 22% of value added produced by EU SMEs.

In contrast, the EU28 SME **business services** sector (and the "other" EU28 SME sector) expanded substantially between 2008 and 2013 with the level of value added up 7% in 2008 relative to 2013, the level of employment up by 5.4% and the number of enterprises up by 10.2%. Today, business services produce roughly 13% of SME value added and employ about 9 Million people (11%), while the other industries offer more than 18 million SME jobs and account for 29% of SME value added.

Finally, the **accommodation/food EU28 SME sector** shows the strongest growth (10.4% in value added and 6.0% in employment) among the five specific sectors highlighted in the present analysis.

Figure 8: The performance of EU28 SMEs in various economic sectors, percentage change from 2008 to 2013

Note: Slovakia is not included in this EU aggregate due to a break in the series. The name "Business S." is used as abbreviation of the NACE category M "Professional/scientific/technical activities", and "Trade" refers to G "Wholesale/retail trade/repair of motor vehicles/motorcycles". Categories in "Others" refer to sections of NACE Rev.2 classifications: B, D, E, H, J, L, and N.

Source: Eurostat, National Statistical Offices and DIW Econ

In terms of the evolution of EU28 SME value added and employment in the various sub-sectors of the non-financial business sector, it is interesting to note that the performance of medium-sized SMEs differs somewhat from that of micro and small SMEs.

- In the EU28 construction sector, medium-sized SMEs show larger losses in value added and employment between 2008 and 2013 than micro and small SMEs;
- In the EU28 manufacturing sector, value added generated by medium-sized SMEs was unchanged between 2008 and 2013 while it dropped by 5% and 6% respectively in the case of micro and small SMEs;
- Medium SMEs benefited more than micro and small SMEs from the upswing in the EU28 in the demand for trade (retail and wholesale) services, business services and goods and services produced by the "other" sector.
- This was mirrored by a somewhat larger increase in employment in the EU28 by medium-sized SMEs than by micro and small SMEs over the period 2008 to 2013 than in the case of trade (retail and wholesale) services and business services.

2.1.4 How did the relative performance of the various SMEs' segments contribute to the overall performance of SMEs in the EU28 from 2008 to 2013?

As a result of the performance trends described above, in the EU28 in 2013 there were **354,308 more SMEs than there were in 2008**, value added posted a small net increase of **44,313.75 million Euros**, and SMEs have **lost 1,962,808 jobs**. This section examines in greater details how SMEs of different sizes, sectors and Member States contributed to the overall performance of the SME sector from 2008 to 2013.

Analysis by class size

The net increase in the overall number of SMEs in the EU28 from 2008 to 2013 is explained by the growth in the number of micro firms (Table 16, Annex V). Micro firms constitute the largest share of the SME population, and their importance since 2008 is virtually unchanged (Table 13, Annex II). Small and medium-sized SMEs, on the other hand, dragged down the performance of the SME sector in terms of the number of SMEs.

In contrast, medium-sized SMEs account for almost 2/3 of the total increase from 2008 to 2013 in the value added generated by SMEs in the EU28 while small SMEs did not contribute at all to the growth in SME value added, and micro SMEs account for 1/3 of the growth in value added.

The overall SME employment losses from 2008 to 2013 in the EU28 are accounted for mainly by micro firms (by 65%) (where 43% of SME jobs are located) and to a lesser extent by medium-size firms (by 27%), while employment levels at small firms fell only slightly (Table 16, Annex V).

Analysis by sector

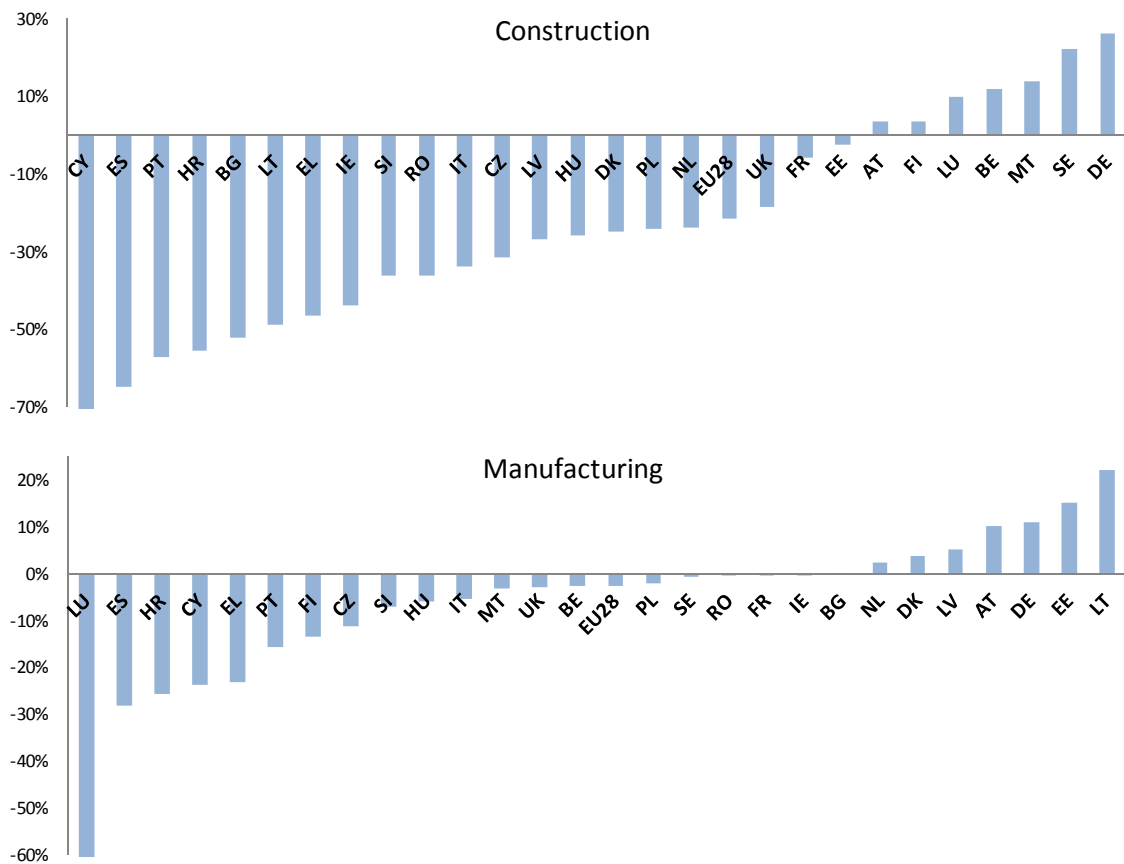

Two sectors (Business services, such as legal, accounting or advertising services, and Others, including real estate activities and information and communication services) posted a sharp increase in the number of SMEs in the recent years (Table 17, Annex V) and account for the bulk of the overall increase in the number of SMEs in the EU28 from 2008 to 2013.

These two industries, together with trade and accommodation/food contributed significantly to the small overall increase in EU28-wide value added generated by SMEs, while manufacturing and, especially, construction pulled down growth in SME value added from 2008 to 2013.

A similar pattern is observed in terms of employment.

Of note is the fact that the construction value added between 2008 and 2013 declined by up to 70% across SMEs in the EU28, and grew in only a handful of countries. The losses in manufacturing value added were relatively less stark (Figure 9).

Figure 9: % change in value added of SMEs in the construction and manufacturing sector in the EU28 2008-2013

Source: Eurostat, National Statistical Offices, DIWecon

Analysis by country

In terms of the relative contribution of individual Member States to the EU-wide performance of SMEs, the increase in the EU28 number of SMEs was driven for the most part by Germany, France, the Netherlands, Slovakia¹⁰, and to a lesser extent, Belgium, Czech Republic, Sweden and United Kingdom (Table 18, Annex V).

The same countries (with the exception of the Czech Republic) also explain the small positive trend in EU28 SME value added while the depressed level of SME activity in Spain, Romania, Italy, Greece, Ireland, Croatia, Hungary dragged down growth in EU-wide SME value added.

The decrease in the overall number of SME jobs in the EU28 is was driven by SME employment losses in Spain, Italy, Portugal, Poland, and Romania.

2.2 The business environment for SMEs in Europe

KEY FINDINGS

- Marked variation in perceived business environment across countries
- **Gaining customers biggest concern** for SMEs in current environment
- **Micro SMEs struggling most with accessing finance**
- Strong correlation between perception of problems and performance

2.2.1 Issues faced by SMEs

This section focuses on the business environment in which EU SMEs operate. The discussion draws on a number of sources, among which reports by the Survey on Access to Finance of SMEs in the Euro Area (**SAFE**) survey data, and the 2014 **Innobarometer**.

The SAFE survey

Key issues and challenges currently faced by SMEs have been very insightfully detailed by the 2013 survey of access to finance of SMEs in the EU (SAFE)¹¹, run jointly for the European Commission and the European Central Bank. The survey asks participants to rank and assess the seriousness of six potential problems:

- Access to finance
- Availability of skilled staff or experienced managers
- Competition
- Cost of production
- Finding customers
- Regulation

Existing reports¹² on the survey focus mainly in the issue of access to finance. In contrast, the present section considers all the issues identified by SMEs and the link between these issues and actual SME performance. More detailed country-specific information is provided in Annex IX of the statistical background document.

Finding customers is the single most pressing problem facing SMEs across the EU28 in 2013, as reported by SMEs of all class sizes. This implies that demand is the most important factor in explaining the performance of SMEs in the past years. As will be shown in section 3.1, this is particularly true for the construction and manufacturing sector, as investment in capital goods and consumer spending are key demand factors for these industries.

All other issues rank broadly the same for SMEs as a whole. But, in some cases, clear differences emerge among SMEs according to class sizes (Figure 10):

- Access to finance is a relatively more important issue for micro SMEs than for small and medium-size SMEs;

Finding customers is the most pressing issue faced by SMEs in the EU28

- Availability of skilled staff or experienced managers is much more of a concern for small and medium-sized SMEs than for micro SMEs;
- Competition, i.e. the pressures that enterprises face on the supply side, is of particular concern to medium-size SMEs.

Figure 10: Most pressing problems facing SMEs in the EU28 in 2013

Source: EC/ECB - SAFE Wave 9

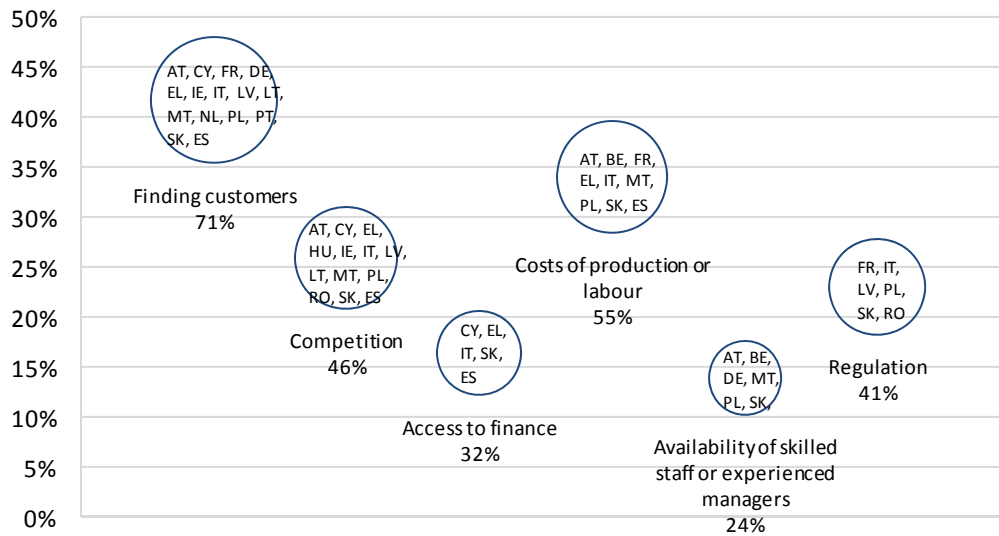

A more detailed review of survey results shows that the problem most frequently cited by SMEs in the EU as either pressing or extremely pressing is difficulty finding customers. Of all survey respondents, 52% rated this issue pressing to extremely pressing, of which 19% judged this issue to be an 'extremely pressing' problem (Figure 10, Annex IX of the statistical background document).

Though access to finance is the least frequently cited problem overall, for a sizeable fraction of SMEs this is extremely pressing.

Moreover, variability across countries is much more pronounced in this than in other factors¹³, with SMEs in countries like Slovakia, Greece, Cyprus, Italy and Spain experiencing significant difficulty in accessing finance, while SMEs in Sweden, Luxembourg, Czech Republic and Finland identifying this problem relatively infrequently (Annex IX of the statistical background document).

Figure 11 identifies Member States in which over 50% of interviewed SMEs report a particular issue as posing a problem to business in their country. The size of the bubble reflects these countries' combined share in total EU28 SMEs, thus capturing the magnitude of the problem in terms of affected SMEs. The vertical location of the bubble reflects the perceived importance of each problem¹⁴.

Figure 11: Importance of problems facing SMEs within Member States, weighted by the proportion of EU SMEs per Member State

Note: The height of the bubble is constructed as the percentage of SMEs that cite each factor as a problem across the displayed Member States, weighted by the proportion of EU SMEs per Member State. This conveys the strength of the perception of a problem across the EU. The size of the bubble is the overall share of EU SMEs that declare the issue to be a pressing problem
 Source: EC/ECB - SAFE Wave 9

For example:

- Finding customers is cited as a problem by over 50% of SMEs in 15 countries that account for 71% of all EU28 SMEs;
- Access to finance, considered a pressing issue by a very large proportion of SMEs in Slovakia (70%), Greece (61%), Cyprus (62%), Italy (50%), and Spain (50%), concerns a relatively low share of SMEs at the EU28-level (32%);
- Similarly, availability of skilled workers is a concern for over half of the respondents from seven countries that account for a relatively low share of EU SMEs (24%).

Once the size of the Member States' economies is taken into account, the ranking of the issues changes, although **finding customers remains by far the most important issue**. This is followed by costs of production or labour, competition and regulation.

Annex IX of the statistical background document provides the results of a statistical analysis examining the relationship between SME performance and the extent to which SMEs are concerned about structural factors (competition, access to finance, costs of production, availability of skilled workforce) and regulatory barriers, or cyclical factors i.e. weak demand (finding customers) and their economic situation in 2013 relative to 2008, before the recession of 2009. Key findings are summarised below.

For most of the factors considered, higher SME concern is associated with worse SME performance in the period 2008-2013.

This negative relationship is particularly marked in relation to access to finance and regulation.

Conversely, SMEs that are more concerned with availability of skilled workers or high costs of production and labour tend to operate in Member States in which SMEs have fared relatively well since the crisis.

Survey undertaken as part of SME 2013/2014 annual report

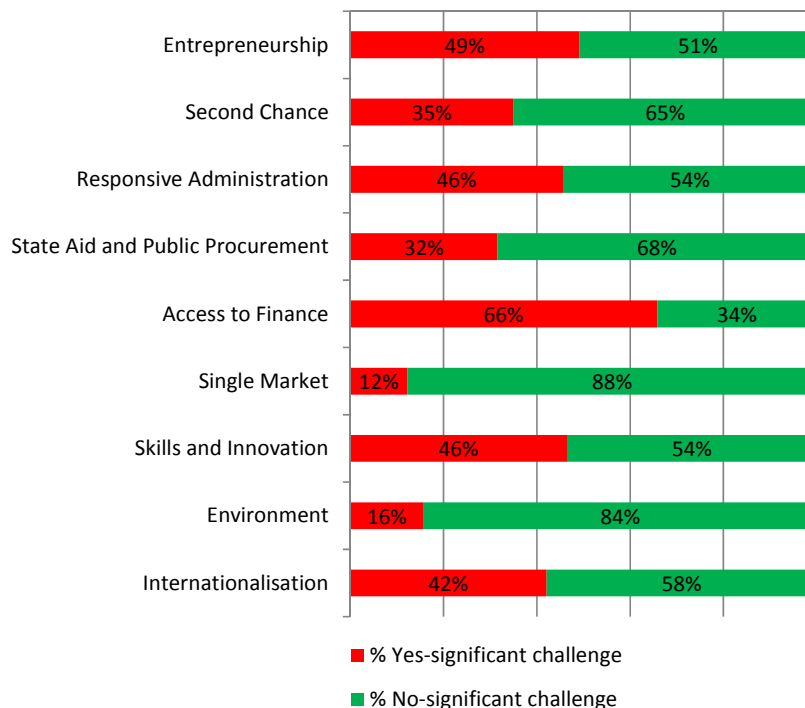

Complementing and expanding the findings from the SAFE exercise, a survey conducted for the SME 2013/2014 annual review further delved on issues encountered by SMEs. This pan European survey covered the scope of the 10 SBA principles and gathered 114 answers from different key stakeholder groups (i.e. 22% SMEs, 67% SMEs stakeholders and 11% policy makers). It is obviously not a representative survey, but due to the high quality of the interviewees, the results form an important ingredient to a comprehensive analysis of the most formidable challenges EU SMEs are facing in the current environment.

Figure 12 shows the most significant challenges identified during the survey. Interviewees could select minimum 3 out of the 9 SBA principles. Within the survey, the Think Small First (TSF) was assessed separately since TSF is more related to governance challenge. Hence, Think Small First does not represent a direct challenge for SMEs.

Access to finance stands out as the major issue chosen by 66% of the respondents. Next in importance are Entrepreneurship (49%), Responsive administration and Skills and innovation (46% each).

At the other end of the spectrum, Single Market (12%) and Environment (16%) are the only two principles below the 30% line, making them the least challenging principles according to survey participants.

Figure 12: Most challenging SBA principles to SMEs at national level - EU28

Source: SME Performance Review 2013/2014 - Survey

For each chosen principle, the interviewees were also asked to precise the particular challenges they found most significant, as detailed in Annex IX of the statistical background document.

- Under Access to finance, the difficulty in accessing to bank credits or loans and the excessive bureaucratic procedures to access EU funds were identified as the main barriers.
- Concerning Entrepreneurship, the lack of financial support measures was the main underlying barrier which also correlates to the access to finance.
- For the Responsive administration, the administrative burden was pointed out, and more specifically the difficulty in managing all of the administrative requirements and requests from various authorities.
- Finally, issues related to the Skills and innovation principle focused on the lack of strategic support in converting an innovative idea into a commercial product/process/service.

2014 Innobarometer

Additional conclusions with regards to how these issues affecting SME performance can be drawn from the **2014 Innobarometer survey, which is devoted to the commercialisation of innovation.**

In particular, the survey results show that **access to funding for R&D appears to be the main obstacle to the commercialisation of innovative products or services.**

When asked how important was public financial support in developing innovations, companies with turnover of 2 million euro or less (micro) are more likely to say that the assistance was important compared to companies with a higher turnover (51%-52% vs. 36%-44%).

In contrast with this finding, medium SMEs (50-249 employees) are the least likely to say public financial assistance was important for developing their innovations (39% vs. 46%-53%). Retail trade companies are the most likely to report that the assistance was important (55%), followed by those in services (50%), manufacturing (47%) and industry (36%).

2.2.2 Key findings from the 2014 review of the SBA implementation

Key findings and conclusions of the results of the SBA policy implementation assessment conducted across the EU28 Member States for each SBA principle over the reference term of 2013/14 in comparison to the last 2 reference periods (i.e. 2011/12 and 2012/13) are presented below.

The assessment is based on the **assessment of policy progress judged by national SME experts**; and the **performance and progress based on SBA indicators extracted from SBA Country Fact Sheets**. It is obvious that the simple counting of measures implemented policy measures is –by and in itself – not a sufficient indicator of policy progress. However, combined with the other information it helps to obtain a more comprehensive picture of the changing SME policy environment in a given country.

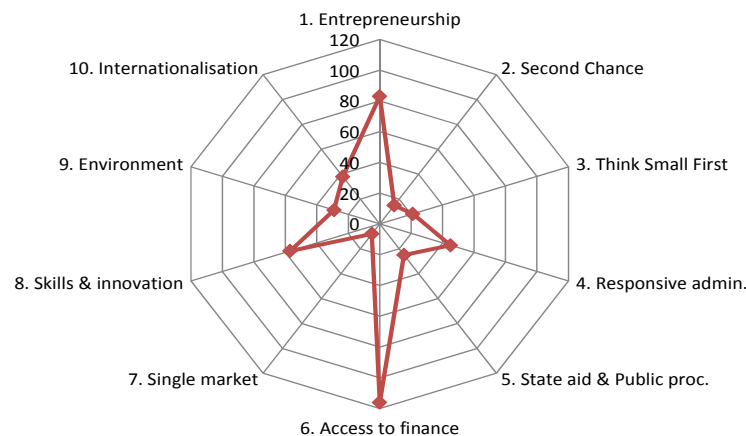

Main focus of SBA policy measures implemented

Overall, the number of SBA related policy measures adopted/implemented during 2013/2014 in EU28 was slightly higher than the previous reference period (422 measures), yet still less than the 2011/2012 reference period, during which 735 measures were adopted/implemented.

As illustrated in Figure 13, **Access to finance** is the SBA principle which saw the **highest policy progress** (116) during this reference period **followed by Entrepreneurship** (83) and **Skills & Innovation** (57), while **Single market** and **Second chance** were the **two lagging principles**, with only 8 and 15 measures, respectively.

When the total number of measures adopted/implemented per principle was adjusted for each SBA principle by dividing with the number of existing sub-measures, the Access to finance (13) still remained on the top followed by Internationalisation (10), Entrepreneurship (8.3), Skills and Innovation (8), and Responsive Administration (6).

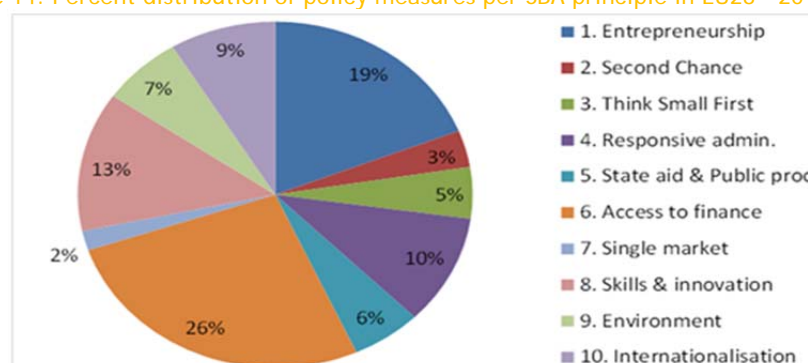

Figure 13: Number of policy measures adopted/implemented in EU28 per SBA principle - 2013/2014

Source: SME Performance Review 2013/2014 - Policy database

Figure 14 shows the percent distribution of policy measures being adopted/implemented amongst 10 SBA principles during this reference period. Access to finance and Entrepreneurship together amount for nearly half of the measures implemented (45%), while Single market and Second chance barely reach to 5% together.

Figure 14: Percent distribution of policy measures per SBA principle in EU28 - 2013/2014

Source: SME Performance Review 2013/2014 - Policy database

When the policy progress achieved during this reference period of 2013/14 is compared to the ones in 2011/12 and 2012/13, the following overall conclusions can be drawn (Figure 15):

- In general, the policy implementation rate achieved during 2011/12 was higher than the subsequent two reference periods;
- Entrepreneurship had the highest implementation rate in cumulative terms, but decreased since 2011;
- Access to finance was given the greatest attention over this reference period of 2013/14 among the SBA principles;
- The number of policy measures under Access to finance, Internationalisation and State aid & Public procurement over this reference period increased significantly compared to the last reference period, while for other principles it decreased or stayed more or less the same.

Overall, **Access to Finance, Entrepreneurship, Skills & Innovation, Responsive Administration, and Internationalisation** had the highest implementation rate both during 2013/14 and during the 2 preceding reference periods, with the only exception of Internationalisation replacing Think Small First on this reference period of 2013/14

Figure 15: Number of policy measures adopted/implemented in EU28 per SBA principle - 2011/2014

Source: SME Performance Review 2013/2014 - Policy database

The **main policy focus** during 2013/14 was directed primarily towards improving the **Access to Finance for SMEs**, which represents more than a quarter (26%) of the new policy measures implemented in 2013/2014. This was followed by **Entrepreneurship, Skills & Innovation, Responsive Administration and Internationalisation**. At the

same time, these 5 SBA principles were also ranked by the SME stakeholders as the most challenging ones for the SMEs (Figure 12).

Potential impacts of the SBA Implementation on Economic Performance and Competitiveness

Economic performance and growth (2.1.2) of the EU 28 Member States have been compared with their SBA implementation status to see whether any potential relationship exist in between. Estonia, Germany, Lithuania and Sweden support the assumption that a high economic performance and growth is accompanied by a high SBA implementation status.

In general, those countries with high SBA implementation status also demonstrated strong economic performance with moderate to strong growth, with some exceptions such as Denmark, Netherlands, Ireland and Hungary. These differences might be attributed to the varying impact of each of the 5 SBA principles investigated on economic performance together with whole socio-economic profile and business ecosystems in those particular countries. Regarding the economic performance and growth of the countries with low SBA implementation status, such as Bulgaria, Greece, Croatia, Poland, Slovenia, and those countries had mainly weak economic performance coupled with declines in all or most of the indicators measured.

Thus, it can be suggested that, with some exceptions that need further investigation, the SBA implementation status at national level may have a potential impact on a country's economic performance and growth.

The potential impact of SBA implementation on the **competitiveness** status of the Member States has also been investigated by looking at the **Global Competitiveness Index (GCI)**¹⁵ and the **Europe 2020 Competitiveness Index**¹⁶ published by the World Economic Forum. Among the 8 Member States (i.e. Denmark, Estonia, Germany, Hungary, Ireland, Lithuania, the Netherlands and Sweden) identified as high performing countries in terms of SBA implementation (i.e. high performing at least in 2 out of 5 key SBA principles explained above), 5 are found to be listed under the stage 3 of development (innovation driven), whilst Estonia, Hungary and Lithuania fell under the transition from stage 2 (efficiency driven) to stage 3, according to the GCI classification.

For stage 3 countries, innovation and business sophistication are the key pillars, while for stage 2 countries: education and training; goods and labour market efficiency; financial market development; technological readiness; and market size are the key pillars of the competitiveness.

Some of the main drivers for a high competitiveness score can be linked to the presence of strong skills and innovation capacity and capability, entrepreneurship and easy access to finance that are captured in the EU2020 Competitiveness Index under the Smart sub-dimension. Sweden, Netherlands, Denmark, Estonia, Ireland and Germany are all high scorers in the Smart dimension.

This is strongly reflected in the assessment of the SBA implementation status of those countries where: DK, DE and NL are all high performers on the Skills & Innovation principle; DK, DE and SE on Access to finance; and EE and IE high performers both in Skills & Innovation and Entrepreneurship principles, which strengthens their competitiveness scores.

In general, it should be noted that the role of the SBA in influencing the performance of SMEs in a given country is rather indirect. Implementation of the SBA helps to create an enabling environment in which they may be able to expand their businesses subject to a other stimuli such as robust macro-economic growth of the economy.

2.3 SME performance forecast for 2014 and 2015

KEY FINDINGS

- EU28 SME value added returned above its pre-crisis level in 2013, and expected to expand in 2014 and in 2015
- Net increase of roughly 740,000 SME jobs by 2015 in EU28
- Across industries:
 - while in the EU28 SMEs in the **service** sectors have recovered since 2008 and are expected to continue to **grow** to 2015,
 - EU28 SME employment in **construction and manufacturing** has exhibited sustained negative growth, and is forecasted to continue to shrink
- Across Member States:
 - SMEs in most Southern and Eastern European economies will still be far from full recovery in 2015

Overall, the business environment for EU28 SMEs will remain fraught with risks. These risks have the potential to negatively affect future growth prospects of the SME sector.

2.3.1 EU28 outlook

Outlook for EU28 SMEs in 2014 and 2015:

Total value added generated by SMEs in the EU28 has returned above its pre-crisis level (Table 4, Figure 17) and is expected to continue to rise by another two percentage points by 2015, expanding by 2.8% and 3.4% in 2015.

Employment in EU28 SMEs is also expected to increase, growing by 0.1% in 2014 and 0.7% in 2015. This amounts to a net increase of roughly 740,000 jobs in SMEs.

Moreover, the number of SMEs is predicted to increase by 0.38% in 2015.

All three groups of SMEs are predicted to expand in 2015, with micro SMEs expected to grow somewhat less rapidly than small and medium-size SMEs (Table 4).

 **+6.3%**

	Value Added	1.12%	2.80%	3.44%
	Employment	-0.51%	0.16%	0.68%
Total	Enterprises	-0.90%	-0.23%	0.38%
	Value Added	0.63%	2.63%	3.22%
	Employment	-0.33%	0.08%	0.61%

Source: Eurostat, National Statistical Offices and DIW Econ

The estimate and forecast in the present report of annual growth in SME value added in 2013 and 2014 are little changed from the forecasts shown in the 2013 report (Figure 16).

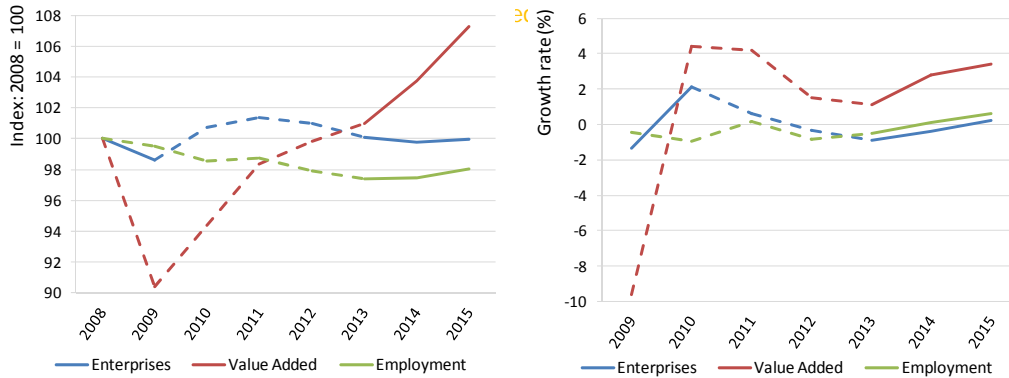

However, SME employment is projected to be significantly weaker in both 2013 and 2014. This reflects the fact that firms, large and small, focus much more than previously expected on improving their productivity.

Figure 16: 2013 estimates and 2014 forecasts of performance of SME sector in EU28

Source: 2013: Eurostat, National Statistical Offices, London Economics. 2014: Eurostat, National Statistical Offices, DIW econ

Figure 17: Forecast level (left) and growth rate (right) of number of enterprises, value added and

2.3.2 The outlook for different SME size classes at the EU28 level

In the EU28, relatively faster growth is expected in employment and value added generation by small and medium firms relative to micro-sized and large enterprises over 2014-2015 (Figure 18). However, growth is predicted to pick up in 2015 for all size classes.

Figure 18: Forecast growth (in %) in value added and employment by size of company in EU28

Source: Eurostat, National Statistical Offices, DIW econ

In terms of number, SMEs will be recovering 2008 levels by 2015; large firms will still be 3% fewer. However, the overall contribution of large companies to value added in the EU will have risen to a greater extent and well above pre-crisis (Figure 19).

Figure 19: Forecast enterprise, value added and employment: SMEs and large firms (2008 = 100) - EU28

Source: Eurostat, National Statistical Offices and DIW Econ

Within SMEs (Figure 20), micro companies are anticipated to grow the most in numbers by 2015, small companies in employment (2%), and medium-sized enterprises in value creation (10%).

Figure 20: Forecast enterprise, value added and employment: micro, small and medium enterprises (2008 = 100) - EU28

Source: Eurostat, National Statistical Offices and DIW Econ

2.3.3 The outlook for SMEs in different sectors at the EU28 level

There are some important differences across sectors within the EU28.

While SMEs in the service sectors in the EU28 have recovered since the 2008 contraction and are expected to continue to grow to 2015, EU28 SME employment in construction and manufacturing has exhibited sustained negative growth, and is forecasted¹⁷ to continue to shrink.

Value added is expected to follow a similar trend.

Figure 21: Forecast growth (in %) in value added by sector -EU28

Source: Eurostat, National Statistical Offices, DIW econ

Figure 22: Forecast growth (in %) in employment by sector - EU28

Source: Eurostat, National Statistical Offices, DIW econ

In 2015, the level of employment generated by the construction sector in the EU28 will have dropped by 16% and value added by up to 25% (Figure 23).

On a slightly smaller scale, value added from manufacturing will have contracted by 2% and employment by up to 12%.

Professional services and other (service) sectors will instead have grown since pre-crisis years in the order of 10%.

Figure 23: Forecast enterprises, value added and employment by sector (2008 = 100) - EU28

Source: Eurostat, National Statistical Offices, DIW econ

2.3.4 The outlook for SMEs in different Member States

Achieving a full recovery and resuming on a path of positive growth in jobs and value added remains an on-going challenge for many European SMEs.

In terms of value added creation, three groups of countries can be identified (Figure 62, Annex VII):

- Those countries where SMEs have achieved a full recovery of pre-crisis levels by 2013, and are forecast to grow even more (at least by 4%) in the period 2013-2015 (top right quadrant)
- Those countries where SMEs have not yet recovered, but are forecast to perform positively in the next years (top left quadrant)
- Those countries that have not yet recovered and are not expected to improve performance in the coming years (bottom left quadrant)

There is a small, positive correlation (R-squared of 0.28) between past and forecast growth rates, implying that, on average, the countries having achieved a recovery are predicted to keep on growing, while countries lagging behind are not expected "converge" by growing at a faster pace. This may point to other macroeconomic or structural factors as drivers of (or obstacles to) SME growth, such as a depressed domestic demand, or a decrease in gross fixed capital formation.

Interestingly, in the case of employment the relationship is somewhat less clear, as the variation between countries increases (Figure 63, Annex VII):

- For some countries, recovery has been achieved and employment is bound to increase even further, albeit mildly (top right)
- For others, employment levels are still not comparable to pre-crisis, despite good prospects for the coming years (top left)

- There are still many countries where SMEs have not recovered the jobs lost during the crisis and are not forecast to expand their labour force in the near future (bottom left quadrant)

Where will SMEs stand in 2015 relative to 2008?

Significant differences across Member States in SME performance are expected to prevail in 2015 relative to 2008. Figure 24 displays SME employment and value added relative to the base year (2008), as well as each Member State's share in total value added generated by SMEs in the EU.

While SMEs in selected Western European countries¹⁸ will have exceeded 2008 levels of value added and employment by 2015, SMEs in many Southern and Eastern European countries¹⁹ will according to the forecast still be far from full recovery.

SMEs in many Southern and Eastern European countries will still be far from full recovery by 2015

In other countries, such as Denmark, Estonia and Lithuania, value added generated by SMEs is expected to be well above pre-crisis years, but employment will remain relatively low.

The opposite is true for Romania, where value added generated by SMEs will still be almost half as high as it was in 2008, while employment will have just recovered.

Countries in which SMEs account for greatest shares in economic activity in the EU (Germany, France, and United Kingdom) are for the most part expected to have recovered or even grown by 2015. Important exceptions include Spain, Italy, and to a much lesser degree the Netherlands.

Figure 24: Forecast value added and employment in 2015, by Member State (2008 = 100)

Note: The size of bubbles reflects Member State's share in total value added generated by SMEs in the EU in 2013.

Slovakia is omitted because of a structural break in the data.

Source: Eurostat, National Statistical Offices, DIW econ

A detailed analysis of cross country variation by sector is developed in Annex VII.

2.4 Comparison of SME performance in the EU28 and other selected countries

KEY FINDINGS

- The EU28 and Japanese economies are very similar, with manufacturing accounting for a quarter of value added and trade for a fifth;
- In the USA, the “other sectors” account for almost half of the total non-financial business sector value added, while in the EU28 these industries only account for 33% and in Japan 35%.
- SMEs more important to the EU28 and Japan economies than to the US economy
- **Overall, SMEs in USA and EU28 performed similarly over the period 2009-2012**
- The wholesale/retail trade and the accommodation sectors of the USA performed better than their European counterparts (+12% vs. +6%, and +14% vs. +12%); conversely, manufacturing and other industries experienced relatively more positive developments in the EU28.

The present section compares the performance of SMEs in the EU28 to that of their counterparts in a number of key world economies²⁰, i.e. the United States and Japan as well as in candidate countries (Iceland, Macedonia, Serbia, Turkey, Albania²¹) and Liechtenstein, Israel, and Norway (Box 1) and Brazil, India and Russia (Box 2).

2.4.1 Comparative analysis of SME performance in the EU28, USA and Japan

Currently, there are 21 million SMEs in the non-financial business sector EU28 while the **United States**²² has **18 million SMEs** and **Japan** has **3.9 million** (Table 5).

The levels of value added generated by SMEs are broadly similar in the United States and EU28, exceeding 3 trillion Euros.

SMEs of the **United States** employ 48 million persons, European SMEs 88 millions and **Japanese SMEs** 33 million.

Table 5: Overview of SMEs in EU28 (2013), USA (2011) and Japan (2012)

	Number of SMEs (millions)	Employment of SMEs (millions)	Value Added (trillion Euros)
EU28	21.6	88.8	3.7
USA	18.2	48.7*	3.3
Japan	3.9	33.5	n.a.

Note: Data for EU28 are relative to 2013, data for USA refer to 2011, and data for Japan refer to 2012. Data for Japan is representative of the non financial business economy, but there is no separate section for N in Japanese industrial classification. In the USA and Japan, “medium” firms can employ up to 299 employees, *: data for micro firms is incremented by including non-employer enterprises from US Census Bureau, to account for self-employed individuals. Source: Eurostat, National Statistical Offices, DIW econ (EU28), US Census Bureau, Japan National Statistical Office, DIWEcon

The figures above do not take into account differences in the size of the respective economies and therefore do not provide a good picture of the relative importance of the SME sector in each of the three economies. A very different picture emerges once the SME indicators are adjusted (Figure 25):

- The number of SMEs in the EU28 is very similar to the United States (1.65 and 1.63 SME enterprises per million of GDP);
- In Japan, there are many fewer SMEs compared to the size of the economy (less than 1 enterprise per million of GDP);
- In contrast, the SMEs of Japan employ relatively more individuals than in Europe or the USA.

Figure 25: Number of enterprises and employment in EU28 (2013), USA (2011) and Japan (2012) as ratios over GDP

Note: Data for EU28 are relative to 2013, data for USA refer to 2011, and data for Japan refer to 2012.

Source: GDP data: Eurostat. SME data for EU28: Eurostat, National Statistical Offices, DIW Econ; SME data for USA: US Census Bureau, DIW Econ; SME data for Japan: Japan National Statistical Office, DIW Econ

Overall:

- In all three economies, SMEs account for the vast majority of enterprises (over 99%);
- EU28 and USA have a similar size class distribution of SMEs, with micro enterprises being the most common; in contrast, Japan tends to have relatively more small firms;
- In all three economies, SMEs employ more than half of the persons employed in the non-financial business sector, but there is significant variation: in the USA they account for 52% of total employment in that sector, in the EU for 66%, and in Japan for 86%;
- In the USA, large firms account for more than half of the value added generated by the non-financial business sector whereas in the EU, SMEs account for the majority (55%).

More detailed data can be found under section XI of the statistical background document.

SMEs account for the vast majority of enterprises in the EU28, Japan and the US

Within the SME sector:

- micro firms account for the vast majority of businesses (95% and 92.5% respectively) In the USA and the EU28, (Figure 26);
- A markedly different picture is found in Japan, where 79% of SMEs are micro and 18% are small firms. The medium sized enterprises represent 2.5% of the SME population.

Figure 26: Enterprise distribution by size class, EU28 (2013), USA (2011) and Japan (2012)

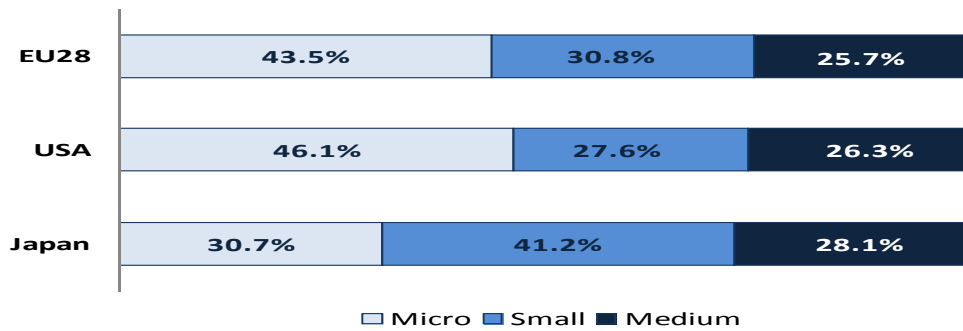

Note: Data for EU28 are relative to 2013, data for USA refer to 2011, and data for Japan refer to 2012. Data for Japan is representative of the non financial business economy, but there is no separate section for N in Japanese industrial classification. In the USA and Japan, "medium" firms can employ up to 299 employees. For the USA, micro firms include self-employed.

Source: Eurostat and National Statistical Offices (EU28), US Census Bureau, Japan National Statistical Office, DIW Econ

Although there is no exact correspondence between the EU28, the USA and Japan due to differences in size classification, a broad comparison between the employment distributions shows that (Annex XI of the statistical background document):

- In the USA fewer people work in SMEs in the non-financial business sector than in Europe (52% as opposed to 66%);
- In Japan more than 86% of individuals working in the business economy are employed in an SME.
- A more granular analysis of the data by size class shows that (Figure 27):
- While in the EU and the USA micro firms account for the largest shares of total SME employment (with the USA micro firms taking up more than 46% of persons employed), in Japan micro firms employ a third of the population, and small firms, instead, account for more than 40%.

Figure 27: Employment distribution by size class, EU28 (2013), USA (2011) and Japan (2012)

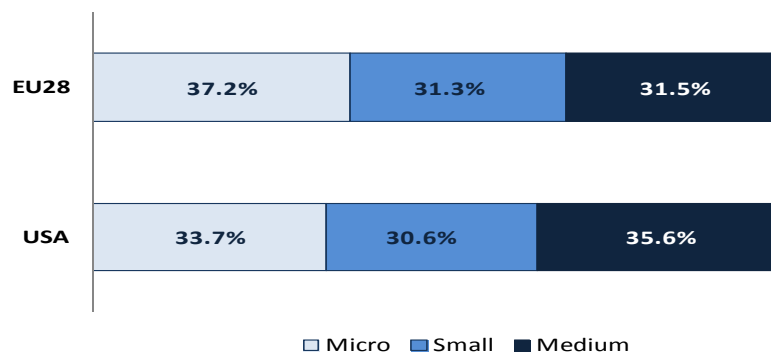

Note: Data for EU28 are relative to 2013, data for USA refer to 2011, and data for Japan refer to 2012. Data for Japan is representative of the non financial business economy, but there is no separate section for N in Japanese industrial classification. In the USA and Japan, "medium" firms can employ up to 299 employees, "large" firms are those with more than 300 persons employed. For the USA: data for micro firms is incremented by including non-employer enterprises from US Census Bureau, to account for self-employed individuals.

Source: Eurostat and National Statistical Offices (EU28), US Census Bureau, Japan National Statistical Office, DIWEcon

In terms of value added, the share produced by large companies in the USA (56% of the total) is higher than the one generated by their European counterparts (42%). (Annex XI of the statistical background document).

In both the EU28 and the USA, SMEs of different sizes contribute almost evenly to the generation of value added (Figure 28). However, the EU28 micro firms account for 37.05% of the total SME-generated value added (against 33.7% in the USA), small enterprises produce 30.8% and medium firms account for 32% (against 35% in the USA).

Figure 28: Value added distribution by size class, EU28 (2013), USA (2011)

Note: Data for EU28 are relative to 2013, data for USA refer to 2011. In the USA, "medium" firms can employ up to 299 employees, ("large" firms more than 300).

Sector-level analysis

Differences in the relative importance of SMEs in the three economies may reflect different structures of the economies with some sectors being more SME intensiven than others.

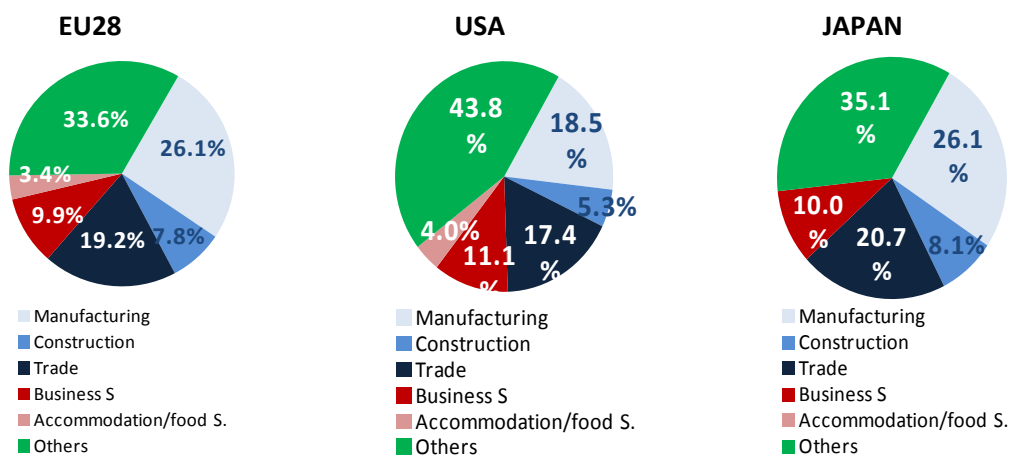

Therefore, as background information, the present section provides information on key structural differences between the three economies and an in-depth discussion of sector distribution by size of SMEs can be found in annex XI of the statistical

background document, together with more information on the distribution of enterprises and employment.

Key facts to note regarding the distribution of **value added** across sectors (Figure 29) are the following:

- the economies of EU28 and Japan are very similar, with manufacturing accounting for a quarter of value added and trade for a fifth;
- in the USA, the “other sectors” account for almost half of the total value added, while in the EU28 these industries only account for 33% and in Japan 35%. Of note is the fact that, in the USA, the industries which drive the differences relative to the EU28 and Japan are “Real estate” (17.6%) and “Information and communication” (9.1%)²³.

Figure 29: Total value added by sector, EU28 (2013), USA (2011) and Japan (2012)

Note: Data for EU28 are relative to 2013, data for USA refer to 2011, and data for Japan refer to 2012. The name “Business S.” is used as abbreviation of the NACE service category M “Professional/scientific/technical activities”, and “Trade” refers to G “Wholesale/retail trade/repair of motor vehicles/motorcycles”. Categories in “Others” refer to sections of NACE Rev.2 classifications: B, D, E, H,J, L, and N. Data for Japan is produced using GDP by sector for year 2012, however, no data was available for “Accommodation/food S.”.

Source: Eurostat and National Statistical Offices (EU28), US Census Bureau, Japan National Statistical Office, DIW Econ

Macroeconomic environment

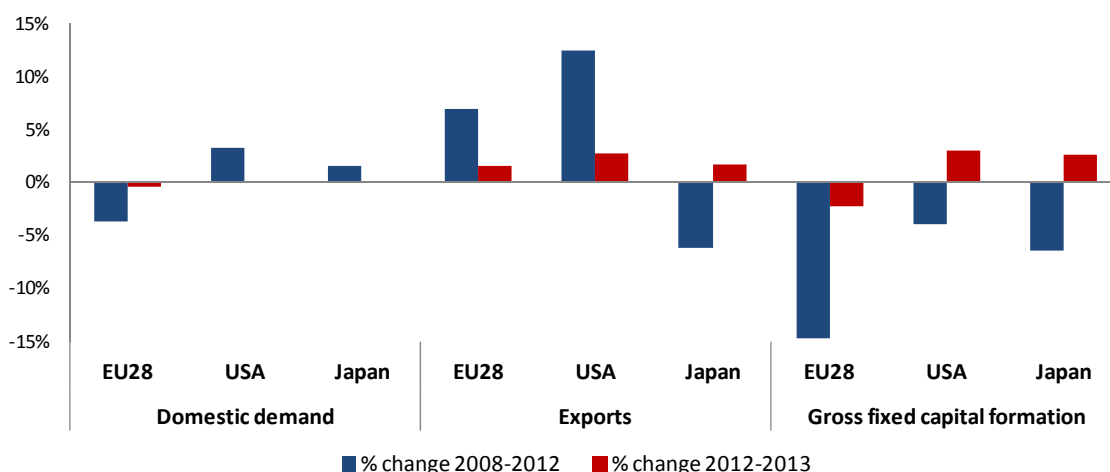

Differences in SME performance among the three economies may also be due to differences in macroeconomic developments.

In particular, the post 2008 period is characterised by a decrease from 2008 to 2012 in domestic demand in the EU28 (-4%) while domestic demand increased, albeit a subdued rate, in the USA and Japan.

Investments in capital goods dropped in all three economies, although in the USA and Japan there were signs of an inversion in this trend in 2013.

The EU28 and the USA experienced an increase in exports from 2008 to 2013, while in Japan such an increase occurred only recently in 2013.

Figure 30 : Developments (jn %) in key macroeconomic factors at constant prices, 2008-2013

Note: no data for 2013 was available for USA and Japan domestic demand at the time of drafting
 Source: Eurostat National Accounts (base year 2005, chain-linked series)

Recent performance trends

The differences in the sectoral make-up of the three economies and in macroeconomic developments noted above explain to some extent the different trends²⁴ in SME performance described below.

In terms of **number of firms** (Figure 31), the EU 28 and the USA followed a path of **mild increase between 2010 and 2011**; the latest EU data show however an inversion in this trend to levels barely above pre-crisis. **Japan** followed a different trajectory, with a **steady decrease in the number of SMEs**.

Figure 31: Number of SMEs in EU28, USA and Japan, 2009=100

Note: * Data for EU28 exclude Slovakia due to a break in series; Data for Japan is representative of the non financial business economy, but there is no separate section for N in Japanese industrial classification. In the USA and Japan, "medium" firms can employ up to 299 employees. Data indexed to 2009 due to a structural break in data for Japan registered in 2008.

Source: Eurostat and National Statistical Offices (EU28), US Census Bureau, DIWEcon

A closer look at these dynamics on a sectoral level from 2009 to 2012, reveals that while for the EU28 and the USA some sectors (such as services) showed signs of positive growth, in Japan there was a widespread reduction in the SME population.

Figure 32: % change in number of SMEs by sector in EU28, USA and Japan, 2009 - 2012

Note: * Data for EU28 exclude Slovakia due to a break in series; data for Japan is representative of the non financial business economy, but there is no separate section for N in Japanese industrial classification. In the USA and Japan, "medium" firms can employ up to 299 employees. Data shown starting in 2009 due to a structural break in data for Japan registered in 2008. The percentage change for the USA is calculated for 2009-2011, due to lack of data for 2012.

All three geographies show SME employment losses. However, they are much more severe in the USA and Japan (Figure 33).

Figure 33: Employment in SMEs in EU28, USA and Japan, 2009=100

Note: * Data for EU28 exclude Slovakia due to a break in series; Data for Japan is representative of the non financial business economy, but there is no separate section for N in Japanese industrial classification. In the USA and Japan, "medium" firms can employ up to 299 employees. Data indexed to 2009 due to a structural break in data for Japan registered in 2008.

Source: Eurostat and National Statistical Offices (EU28), US Census Bureau, DIWEcon

Similarly to the evolution of enterprises, in the case of employment the services sectors were those where (mild) growth occurred after 2009 in both the EU28 and the USA. In Japan, on the other hand, SME employment decreased in all sectors of the economy.

The sharp declines in SME construction employment are very similar in all three economies.

Figure 34: % change in employment of SMEs by sector in EU28, USA and Japan, 2009 - 2012

Note: * Data for EU28 exclude Slovakia due to a break in series; data for Japan is representative of the non financial business economy, but there is no separate section for N in Japanese industrial classification. In the USA and Japan, "medium" firms can employ up to 299 employees. Data shown starting in 2009 due to a structural break in data for Japan registered in 2008. The percentage change for the USA is calculated for 2009-2011, due to lack of data for 2012.

Source: Eurostat and National Statistical Offices (EU28), US Census Bureau, DIWEcon

Due to the lack of data for Japan, the evolution of value added can be assessed only for the EU28 and the USA (Figure 35). Following the 2008 crisis, SMEs of both regions experienced **large losses in terms of value added**.

SME value added declined much more sharply in 2009 in the EU28 than in the USA. In **the USA**, a temporary recovery followed immediately in year 2010, and followed by a dip in 2011; in the EU28, instead, the losses in value added were up to 10%, and the recovery took place at a slower pace. A recovery to pre-crisis levels in the EU was only experienced in 2013.

Figure 35: Value Added of SMEs in EU28 and USA, 2008-2013 -2009=100

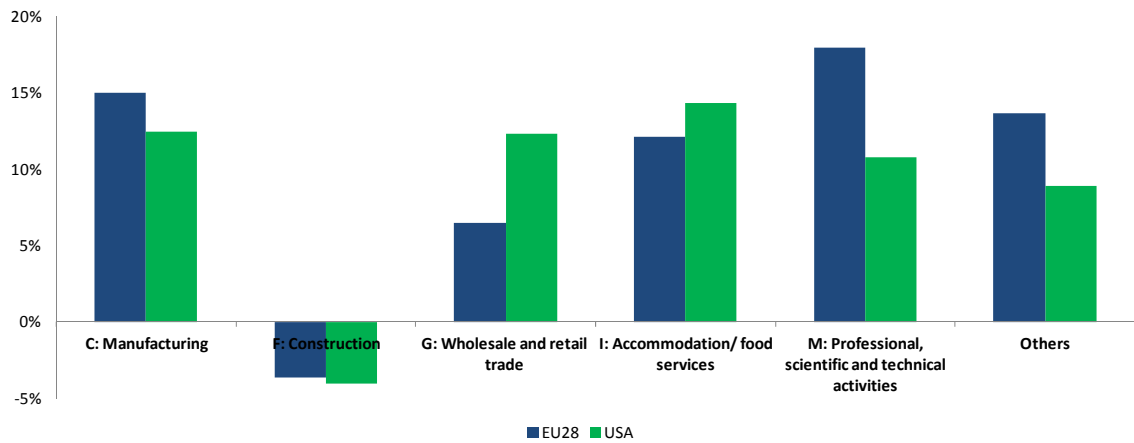

Note: * Data for EU28 exclude Slovakia due to a break in series; Data for Japan is representative of the non financial business economy, but there is no separate section for N in Japanese industrial classification. In the USA and Japan, "medium" firms can employ up to 299 employees. Data indexed to 2009 for comparability with previous charts. Data for USA for 2012 and 2013 are not yet available

Source: Eurostat and National Statistical Offices (EU28), US Census Bureau, DIW Econ

An analysis of the performance of the different sectors in terms of value added for the period 2009-2012 shows that the wholesale/retail trade and the accommodation sectors of the USA performed more positively than in the EU. Conversely, manufacturing and other industries experienced relatively more positive developments in the EU28.

Figure 36: % change in value added of SMEs by sector in EU28 and USA - 2009-2012

Note: * Data for EU28 exclude Slovakia due to a break in series; data for Japan is representative of the non financial business economy, but there is no separate section for N in Japanese industrial classification. In the USA and Japan, "medium" firms can employ up to 299 employees. Data shown starting in 2009 due to a structural break in data for Japan registered in 2008. The percentage change for the USA is calculated for 2009-2011, due to lack of data for 2012.

Latest SME snapshot

Across all economies, SMEs account for more than 99% of firms in the non-financial business sector (annex XIII of the statistical background document).

In terms of **value added** (annex XIII of the statistical background document) **Israel, Norway and Liechtenstein** present a **similar distribution to the EU28**, with SMEs accounting for 65%, 67% and 69%. SMEs in Iceland and Serbia account for a slightly larger share (72% and 71% respectively). In Macedonia, Albania, and Turkey, SMEs produce more than 75% of the value added. In the EU28, SMEs employ just less than 60% of the labour force, and a similar distribution is found in Serbia, Turkey, Israel and Liechtenstein (annex XIII of the statistical background document). SMEs offer relatively more jobs in Albania (70%), Iceland (70%) and Macedonia (66%).

As can be seen in annex XIII of the statistical background document, **in all countries, micro firms account for at least 80% of the SME population, and medium firms only for a maximum of 2%**. In Turkey, the share of micro enterprises reaches 97%, while the lowest share is found in Liechtenstein (86%). In the case of value added (annex XIII of the statistical background document), the allocation across size classes is broadly similar in all the economies under analysis, with the exception of **Norway, where micro SMEs account for more than 55% of SME value added**.

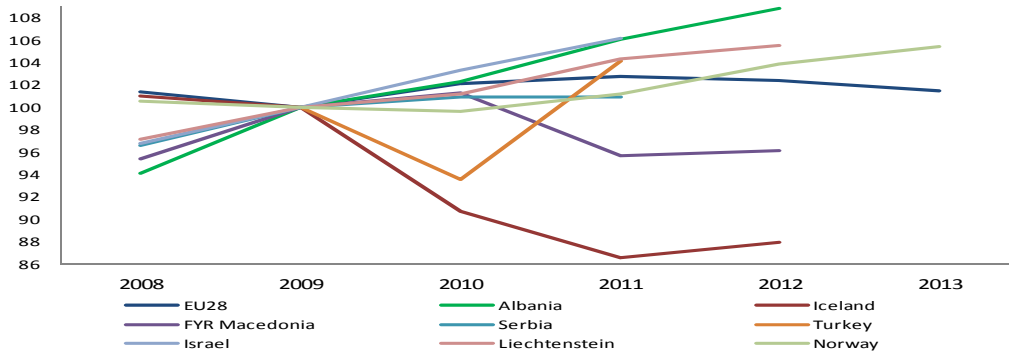

In terms of employment, with the exception of Iceland and Norway, in all the economies at least 40% of the persons employed are working in micro firms. The share of employment in small firms is quite diverse across countries, ranging from a minimum of 18% (Turkey) to a maximum of 37% (Liechtenstein) (annex XIII of the statistical background document). Medium firms account for 20 to 28% of jobs in all these economies.

Recent performance trends

The developments in the number of SMEs proved very volatile in all countries, whilst the EU28 registered a more stable path during the years of the **crisis** (Figure 37). **Albania, Israel and**

Liechtenstein experienced years of sustained growth; in Macedonia and Turkey, SME growth had at least one negative period (2011 and 2010 respectively). Iceland registered a negative trend from 2008 to 2011, but is now set on a positive trajectory. **In all countries but Iceland, there are currently more SMEs than there were in 2008.**

Figure 37: Number of SMEs, EU28 and partner countries, 2009=100

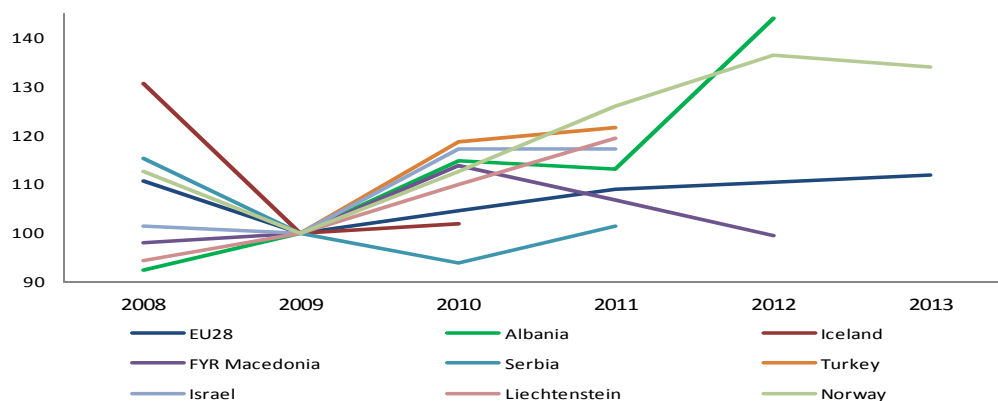

Note: in the Israel SME classification, "micro" firms employ 0-9 persons, "small" firms employ 10-49, and "medium" employ 50 to 200. In the case of Turkey, "micro" firms employ 1 to 19 persons, "small" firms employ 20 to 49, and "medium" firms employ 50 to 249 persons. Data for the EU28 exclude Slovakia due to a break in the series.

Source: Eurostat and National Statistical Offices (EU28), DIW Econ

The performance of SMEs in terms of value added is also quite different between the EU28 and the candidate countries, as shown in Figure 38. **The EU suffered an immediate setback in 2009, with a loss of almost 10%, and Iceland, Norway, Israel and Serbia performed similarly.** In the following years, these economies posted substantially different trends. **While the EU resumed a mild recovery, Serbia experienced a second year of negative growth and Israel exhibited a strikingly positive performance. Albania and Macedonia only registered negative rates starting 2011 (-1.4% and -6.2%), and while Albania recovered swiftly, Macedonia lost an additional 6.8% of value added in 2012. Turkey and Liechtenstein, in contrast, did not experience losses during the crisis.**

Figure 38: Value added of SMEs, EU28 and partner countries 2009=100

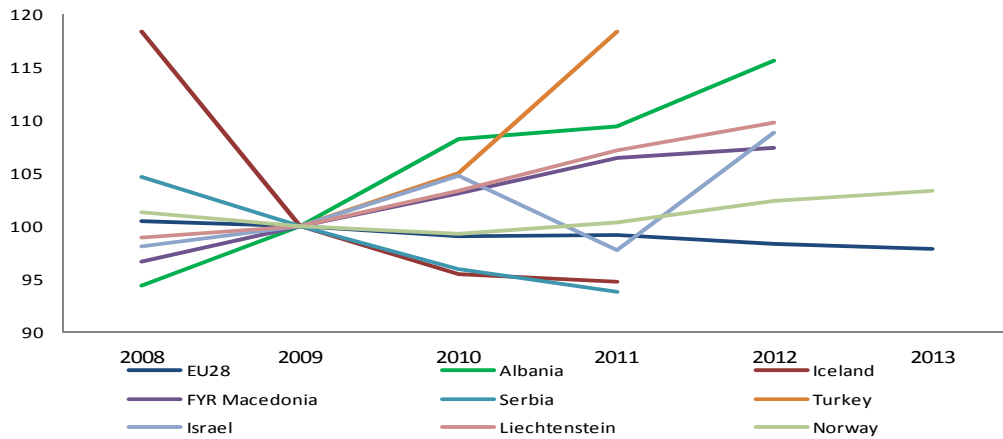

Note: in the Israel SME classification, "micro" firms employ 0-9 persons, "small" firms employ 10-49, and "medium" employ 50 to 200. In the case of Turkey, "micro" firms employ 1 to 19 persons, "small" firms employ 20 to 49, and "medium" firms employ 50 to 249 persons. Data for the EU28 exclude Slovakia due to a break in the series.

Source: Eurostat and National Statistical Offices (EU28), DIW Econ

While the EU has seen its employment levels drop three times since onset of the crisis, the **SMEs in the other countries performed quite differently**, and in some cases, have markedly **expanded** their labour force (Figure 39). **SMEs in Albania, Macedonia, Turkey, and Liechtenstein generated more and more jobs in 2008-2012**. In contrast, SME employment declined for three consecutive years in Iceland and Serbia.

Figure 39: Employment in SMEs, EU28 and partner countries, 2009=100

Note: in the Israel SME classification, "micro" firms employ 0-9 persons, "small" firms employ 10-49, and "medium" employ 50 to 200. In the case of Turkey, "micro" firms employ 1 to 19 persons, "small" firms employ 20 to 49, and "medium" firms employ 50 to 249 persons. Data for the EU28 exclude Slovakia due to a break in the series.

Source: Eurostat and National Statistical Offices (EU28), DIW Econ

Box 2: SMEs in EU28, Brazil, India and Russia

Brazilian SMEs number 4.2 millions and employ to 23 million individuals; their **Indian** counterparts number 24.5 million and employment reaches 73 millions.²⁵ Lastly, in **Russia** there are 1.7 million SMEs, generating 11.4 million jobs (Table 7). More information on the distribution and role of SMEs in these countries is available in annex XII of the statistical background document.

Table 7: Overview of SMEs in EU28 (2013), Brazil, India and Russia (2011)

	Number of SMEs (millions)	Employment of SMEs (millions)	Value Added (trillion Euros)
EU28	21.6	88.8	3.7
Brazil	4.2	23.3	0.6
India	24.5	73.0	n.a.
Russia	1.7	11.4	0.7*

Note: Data for EU28 are relative to 2013, while for Brazil, India and Russia are relative to 2011; *turnover data; SME size class definitions for Russia: Micro (0-15), Small (16-100), Medium (101-250).

Source: Eurostat and National Statistical Offices (EU28), DIWEcon

Recent performance trends

- **In contrast with the EU trends, in Brazil, India and Russia SMEs grew in number by respectively 10%, 6% and 35% from 2008 to 2011.** (annex XII of the statistical background document).
- **Similarly, employment in both Brazil and India experienced high growth rates in the period 2008-2011: Brazil gained 4 million SME employees (+18%) and India almost 6 million (+9%) in these 4 years.** In Russia, conversely, employment followed a trend of gradual decrease, with negative growth rates in the period 2008-2011 (annex XII of the statistical background document).
- In terms of **value added, Brazilian SMEs experienced a sluggish growth** in the period 2008-2009, but soon recouped with two consecutive years of high growth, with a cumulative growth of 56% from 2008 to 2011. In **Russia**, similarly to EU28, there were **large losses in value added from year 2008 to 2009, but strong growth rates** characterised the subsequent years (annex XII of the statistical background document).

3 DRIVERS OF SME ECONOMIC PERFORMANCE IN RECENT YEARS AND INTO THE FUTURE

While the previous chapter presented a number of key facts on the recent performance of SMEs in the EU28 and a selection of other countries, the present chapter focuses on a number of factors which can explain the observed differences in SME performance in the EU28.

The chapter first focuses on macro-economic developments as drivers of the demand for goods and services produced by EU28 SMEs (section 3.1).

Next, in light of the importance of exports of goods and services and innovation to the economic recovery in Europe, the chapter discusses the issue of the internationalisation of SMEs (section 3.2).

Finally, the chapter examines the performance of SMEs in high tech manufacturing and knowledge intense service SMEs, two economic segments which are expected to be key growth engines in the future (section 3.3).

3.1 Macro-economic drivers of demand for goods and services produced by SMEs

KEY FINDINGS

Macroeconomic trends

- Sharp decline in gross capital formation (housing, structures, plant and equipment) in a large number of Member States;
- Very limited increase or declines in consumer spending and government spending in many Member States;
- Much stronger growth in exports of goods and services than in final domestic demand in most Member States.

Impact of macroeconomic trends on SME performance:

- Household demand has a significant impact on the performance of SMEs in the accommodation and "other" sectors;
- On the other hand, construction value added is mainly affected by gross fixed capital formation;
- In all sectors, intermediate demand is positively affecting SME growth of value added;
- For accommodation and trade firms, the factors that affect employment growth are household expenditure and intermediate demand by other sectors;
- Gross fixed capital formation significantly affects employment in both construction and business services

3.1.1 Main clients of SMEs in key economic sectors in the EU28

Section 2.2.1 highlighted that for the vast majority of SMEs, finding customers was the most pressing problem experienced in the recent years. The present section sheds light on the importance of macroeconomic factors, and in particular demand, in explaining the large differences identified in SME performance across countries, size classes, and sectors.

Unfortunately, information on the various types of clients served by SMEs does not exist at the EU28-wide level.

However, the input-output tables produced by Eurostat, which show **the distribution of sales to other industries and end-users such as consumers, government and foreign buyers for a large range of industries**, and provide useful insights on the likely customers of SMEs.

For example, the summary input-output table below (Table 8) shows that, in the EU27:

- Households buy 46% of output generated by the retail and wholesale sector;
- The spending on capital goods (including housing) by households and government accounts for 60% of the sales of the construction sector;

- In contrast, the various industries are together the largest customer of the manufacturing sector, accounting for 54% of all sales;
- Public administrations and the business sector are other important clients of the retail and wholesale sector;
- Sales of the "other sector" are broadly distributed across the group of the group of "other" industries, households and government.

Table 8: Key demand drivers of sectors of key importance to SMEs - EU27, 2009

	Intermediate demand (industries)						Final demand			
	Manufacturing	Construction	Trade	Business services	Accommodation/food services	Others	Final consumption expenditure by households	Final consumption expenditure by government	Gross fixed capital formation	Exports
Manufacturing	31%	6%	3%	1%	2%	11%	22%	1%	9%	16%
Construction	2%	19%	1%	1%	0.4%	13%	3%	0.2%	60%	0.3%
Trade	17%	4%	5%	1%	2%	11%	46%	2%	5%	7%
Business S.	20%	4%	10%	16%	1%	30%	2%	3%	7%	7%
Accommodation/ food S.	2%	1%	2%	1%	1%	9%	82%	0.4%	0%	2%
Others	9%	2%	5%	3%	1%	24%	27%	23%	2%	3%

Note: The name "Business S." is used as abbreviation of the NACE category M "Professional/scientific/technical activities", and "Trade" refers to G "Wholesale/retail trade/repair of motor vehicles/motorcycles". Categories in "Others" refer to sections of NACE Rev.2 classifications: B, D, E, H, J, L, and N. The percentages show how each industry in the rows allocates output across the users in the columns, which are intermediate users (i.e. other firms) and final demand (i.e. households, governments, etc). 2009 is the last year for which data are currently available

Source: Eurostat Input Output tables (Domestic use, EU27)

3.1.2 Impact of macroeconomic performance on SME performance

The brief overview of the main features of the EU27 input-output table highlighted the fact that the **key macro-economic drivers of demand for SME goods and services will be different for different industries**. This is particularly important in understanding why certain sectors have suffered serious setbacks since 2008 (such as construction) and what channels could be stimulated in order to improve the economic performance of SMEs, thus helping them reach full recovery.

The key noteworthy macroeconomic developments since 2008 are:

- a sharp decline in gross capital formation (housing, structures, plant and equipment) in a large number of Member States;
- a very small increase or declines in consumer spending and government spending in many Member States;
- a much stronger growth in exports of goods and services than in final domestic demand in most Member States.

Domestic and foreign demand developments contrast sharply in many EU Member States. Domestic demand (adjusted for inflation) is higher in 2013 than in 2008 in only a handful of countries (Germany, Luxembourg, Sweden, Poland, and to a lesser extent, France, Belgium and Austria) (Figure 40). In contrast, exports of goods and services (adjusted for inflation) are higher in 2013 than in 2008 in all but 6 Member States.

Figure 40: Domestic demand and exports by Member State, % change 2008-2013 (constant prices)

Source: Eurostat - national accounts data

The importance of developments in various components of total aggregate demand for SMEs is assessed statistically using annual data from 2009 to 2012.²⁶ The key findings of such statistical analysis are provided below.²⁷

Key macroeconomic determinants of growth of SME value added:

- Household demand has a significant impact on the performance of SMEs in the accommodation and "other" sectors;
- On the other hand, construction is mainly affected by gross fixed capital formation;
- In all sectors, intermediate demand is positively affecting SME growth of value added;
- Government spending has a significant (positive) impact on performance of accommodation and business services.

Key macroeconomic determinants of growth of SME employment:

- For **accommodation and trade firms**, the factors that affect employment growth are **household expenditure** and intermediate demand by other sectors;
- Gross fixed capital formation by households and governments significantly affects both construction and business services;

The growth of value added in the total economy (the proxy for intermediate demand) has a significant effect on the employment growth of all sectors.

3.2 Internationalisation of SMEs

KEY FINDINGS

- After 2008, exports were the key growth driver in many EU Member States
- **Involvement of SMEs in export activities still limited in EU28:**
 - Share of exporting SMEs below 30% (for trade in goods)
 - Propensity to export grows with size of the firm
 - SMEs (particularly micro) are mostly located in sectors with low export intensity
- **But exports have a ripple effect on the whole value chain:**
 - For example, an increase of 10% in EU exports increases value added of the manufacturing sector by 2.7% and of the construction sector by 0.2%.

The previous section highlighted the fact that the impact of developments in the various aggregate demand components varies markedly across the economic sectors in which SMEs are particularly active and the first section of this chapter has brought to the fore the importance of the growth in exports of goods and services to the overall economic recovery and the .

Therefore, the present section looks at the impact of foreign demand from a different angle by focusing on the export performance of SMEs and assessing the involvement of SMEs in export-oriented industries. The analysis below focuses on the following questions:

- **What is the relevance of internationalisation for SMEs?**
- **To what extent do European SMEs export?**
- **Are European SMEs located in export-inclined industries?**
- **What are the indirect benefits of exports for the (domestic) value chain?**

3.2.1 General discussion of the internationalisation of SMEs

Internationalisation has become increasingly important to the competitiveness of enterprises of all sizes. In today's environment, SMEs that start with a global strategy can move quickly to take advantage of cross-border activities, which provide opportunities not only for revenue growth but also for the exchange of knowledge and the enhancement of capabilities, thereby strengthening the long-term competitiveness of the firm. Despite the common understanding of the importance of internationalisation, there are still many internal and external barriers that impede the internationalisation of SMEs. Moreover there is a lack of data on the actual export performance of SMEs and the challenges and issues they face.

A few key facts on the internalisation of the EU-28 SMEs

A 2009 study by the Commission analysed all activities that put SMEs into a meaningful business relationship with a foreign partner: exports, imports, foreign direct investment, international subcontracting and international technical co-operation.²⁸

The most relevant finding was that 25% of EU27 SMEs export or have exported at some point during the last 3 years. However, international activities are mostly geared towards other countries inside the internal market and only about 13% of EU SMEs are active in markets outside the EU. The results showed that export-oriented SMEs show higher growth of turnover and employment than SMEs catering for the domestic market. In addition, export oriented SMEs are also more innovative. Hence, the study concluded that it is in the public interest to support SMEs to internationalise.

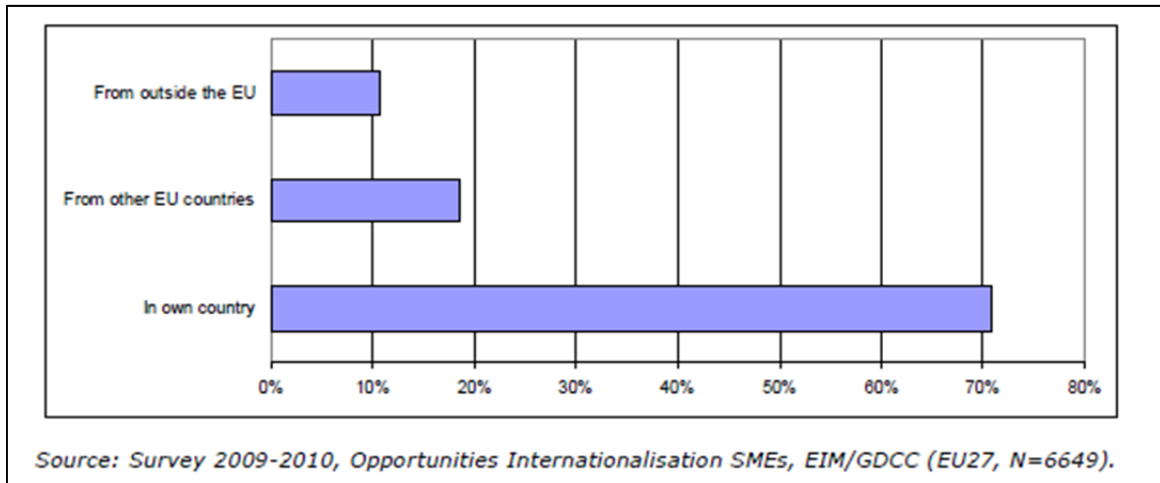

The study also presented evidence of the need to support greater internationalisation:

- International SMEs create more jobs: internationally active SMEs report an employment growth of 7% versus only 1% for SMEs without any international activities;
- International SMEs are more innovative: 26% of internationally active SMEs introduced products or services that were new for their sector in their country; for other SMEs this is only 8%;
- Public support goes largely un-noticed: only 16% of SMEs are aware of public support programmes for internationalisation and only a small number of SMEs use public support;
- European SMEs are more internationally active than US and Japanese SMEs. Overall, European firms are more active than their counterparts in Japan or the US. Even if only extra EU exports are considered they still perform better;
- Most often SMEs start international activities by importing. SMEs that both import and export started with import twice as often (39%) than with exports (18%).

A subsequent study, which was focused on opportunities for the internationalisation of SMEs in 12 external markets, reviewed ways of better connecting European SMEs to international markets, and specific measures to facilitate the access of European SMEs to these markets.

According to the study's results, internationalised European SMEs derive only a small share of their turnover from business activities from third markets (as shown in Figure 41).

Figure 41: Distribution of total turnover among three market areas, average percentage turnover of internationalised SMEs

Other key findings include the following:

- 42% of EU SMEs are engaged in some form of internationalisation;
- 25% of EU SMEs are exporting;
- 13% of EU SMEs are exporting to third countries;
- Importing is often the first stage in the internationalisation process for SMEs;
- Only 10% of the turnover of the (42%) internationalised SMEs is from clients in third countries.

Figure 42: For various modes of internationalisation, the percentage of SMEs in EU27 involved in international business activities, having concrete plans to start or none at all

Despite all the existing support mechanisms in place both at national and EU levels aiming to help SMEs in their internationalisation, many barriers still exist - both internal to the firm and external. External factors impeding the internationalisation of SMEs include national and international administrative rules as well as formal and informal trade barriers. Internal barriers for SMEs trying to internationalise can include cultural differences, lack of information or skills, insufficient networks, language barriers and lack of access to necessary finance.

Internal barriers for SMEs trying to internationalise can include cultural differences, lack of information or skills, insufficient networks, language barriers and lack of access to necessary finance

Only one in four EU SMEs export

The Commission study on internationalisation opportunities for SMEs in 2011 also found that SMEs face particular obstacles to tapping the global market, not least when it comes to access to market information, locating possible customers and finding the right partners, even though international markets offer substantial opportunities for European companies. They face more complex issues such as compliance with foreign laws, for example mandatory rules of contract law, customs rules, technical regulations and standards, managing technology transfer and protecting intellectual or industrial property rights. In dealing with such challenges SMEs are usually less well equipped than larger enterprises with in-house expertise and financial or human resources.

Considering firms of all sizes, the meta-analysis of the academic literature shows a generally positive relationship between internationalisation and performance. However, for small-scale companies, investigation of impact of internationalisation on performance delivers more ambiguous results. When considering firms of all sizes, size of the firm is expected to be inversely related to the degree of internationalisation: to simplify, the larger the firm the higher its involvement in international activities (trade, investment).

However, academic literature shows an absence of correlation for SMEs between size of the firms and export intensity - as measured by the ratio of exports to sales. This means that the smallest firms are not necessarily those exporting the least, among the SMEs. This is likely to be due to the existence of a niche strategy for some small and micro-enterprises that subsequently exhibit very high export levels.

Moreover, recent studies²⁹ have shown that internationalising sales improves survival probabilities and is correlated with innovation levels.

In terms of SME export orientation:

- A 2012 Department for Business, Innovation and Skills Small Business Survey noted the number of UK "SMEs whose export is falling, with 19% of small businesses categorised as exporters, down from 24% before the financial crisis. This is below the EU average of 25%".³⁰

3.2.2 European SMEs' overall propensity to export

While internationalisation can take many forms (exports, imports, foreign direct investment, international subcontracting), export and import activities are the most common among EU SMEs, and exports will be the main focus of this section.

Export performance of goods-producing SMEs

In 2011, in the majority of the EU27, the share of SMEs exporting goods in the total number of SMEs in the goods-producing industry sector was well below 30%.

It is worth noting that the **size** of the country may explain to some extent higher tendency of SMEs to engage in international exports of goods as the countries with the highest shares of such SMEs are **Luxembourg, Estonia, Ireland** (for extra-EU flows), **Denmark, Austria, and Belgium** (Figure 43).³¹

Figure 43: Share of exporting SMEs in the EU27, industry sectors

Note: "industry" refers to NACE sections B, C, D, E.

Source: Eurostat- COMEXT statistics on international trade in goods

Additional evidence on exporting SMEs

In a set of 5 countries, which together account for almost 60% of EU SMEs, the number of exporting SME firms in recent years³² does not reach 12% (Table 9). The overall percentages are very low and range from a low of 4% in Italy and Spain to 11% in Germany and the United Kingdom.

As will be seen in the next section, this low export propensity is mainly due to the fact that in all EU economies, micro firms account for the majority of enterprises and generally show a very low propensity to export.

The tendency to export grows progressively with size, and large enterprises are those showing the highest export propensity in all five countries.

Table 9: Exporting SMEs in 5 largest EU28 countries by number of SMEs (absolute levels and in 5 of total)

	Italy (2011)	France (2013)	Spain (2010)	Germany (2010)	United Kingdom (2011)
Number of exporting firms by size class					
0-9	122,851	90,811	26,519	255,500	153,300
10-49	55,118	(0-20 p)	64,239	66,200	34,400
50-249	10,739	25,421 (20 to 250 p)	14,267	23,500	10,600
Large	1,936	3,403	2,702	8,400	2,900
Total	190,851	119,635	107,728	353,600	201,200
Percentage of exporting firms over total number of firms by size class					

0-9	3%	4% (0 to 250 p)	1%	9%	9%
10-49	29%		48%	47%	20%
50-249	49%		85%	68%	34%
Large	54%	70%	93%	80%	41%
Total	4%	5%	4%	11%	11%

3.2.3 Key facts about the involvement of SMEs in export-oriented industries

In order to gain a deeper understanding of the involvement of SMEs in exports of goods and services and overcome the problem of a lack of comprehensive data on export participation by SMEs, the analysis below focuses on the export intensity of the various economic sectors in which SMEs are active.

To that end, the SME data assembled for the purpose of the 2014 SME Review³³ is combined with information from Eurostat's Input Output tables.³⁴ The latter provide detailed information on a sector's export sales.³⁵

The present analysis focuses on the EU27 as the input-output data from Eurostat do not yet cover Croatia.

The export intensity indicator of a particular industry is defined as the ratio of exports over total sales for each industry. Export intensity is defined as ranging from "very low" (the share of exports over total sales of an industry is less than 5%) to "low" (5% to less than 10%), "medium" (10% to less than 20%), "high" (20% to less than 40%) and "very high" (more than 40%).

Each industry is then allocated to one of these export classes and, for each enterprise class (micro, small, medium, large), the share of a particular export class in the total value added and employment of the enterprise class is computed.

The figure below clearly shows that export-participation (in terms of number of enterprises) in export-oriented industries increases with the enterprise size.

The vertical axis on the figure below (Figure 44) measures export intensity while the horizontal axis measures the share of each enterprise size class in the total enterprise population.³⁶

70% of micro SMEs and 60% of small SMEs are active in industries with 'very low' or 'low' export intensity

Overall, 70% of micro SMEs and 60% of small SMEs are active in industries with very low or low export intensity and only 15% of micro SMEs and 24% of small SMEs are active in industries characterised by high or very high export intensity.

In contrast, 35% of medium SMEs and 39% of large enterprises are active in industries with high or very high export intensity and only 47% of medium SMEs and 43.5% of large enterprises are active in industries with very low or low export intensity.

Figure 44: Distribution of the population of SMEs and large enterprises across different export-intensity classes - EU27, 2009

Source: Elaboration of SME database and Eurostat - Input Output tables EU27

A similar picture emerges from an analysis of the distribution by value added and export intensity size class.

The value added generated by micro and small SMEs is concentrated in industries with a very low export focus. Their share in very low and low export-oriented industries accounts for 70% and 55% of their respective total value added.

In contrast, 40% and 41% respectively of the total value added of medium and large firms is generated in high and very high export intensive sectors.

Figure 45: Distribution of the value added generated by SMEs and large enterprises across different export-intensity classes - EU27, 2009

Source: Elaboration of SME database and Eurostat - Input Output tables EU27

The analysis clearly shows that, while exports are important for a group of SMEs, the vast majority of SMEs, especially micro and small SMEs, operate in industries with very

limited export focus. This is true in the majority of Member States - SMEs typically operate in industries that are characterised by a very low or low tendency to export (Figure 46). A more detailed analysis can be found in Annex XI.

Countries where more than 60% of SMEs are primarily domestic-demand facing are: Greece, Italy, France, Cyprus, and Finland.

At the other end of the spectrum are trade-oriented countries such as Estonia, Austria, Hungary, and Luxembourg, where the share of SME enterprises in sectors of low export intensity is relatively low.

Figure 46: Shares of the number of SMEs in low export intensity sectors in EU27 Member States, 2009

Source: Elaboration of SME database and Eurostat - Input Output tables EU27

In terms of value added, in most of the Member States, SMEs produce between 25% and 45% of their value added in sectors that are not export intensive (Figure 47).

Conversely, in the case of a few countries, such as Estonia, Hungary, Luxembourg, value added creation is densely concentrated in sectors that have high or very high export intensity, whereas low export intensity industries only account for up to 30% of SMEs. A more detailed analysis can be found in Annex XI.

Figure 47: Shares of the value added generated by SMEs in low export intensity sectors in EU27 Member States, 2009

Source: Elaboration of SME database and Eurostat - Input Output tables EU27

3.2.4 Impact of increase in foreign demand on economic sectors of key importance for SMEs

The analysis above shows that **the vast majority of SMEs are not operating in industries with a strong export focus.**

However, this does not mean that such SMEs would not benefit from a boost in exports, as any increase in foreign demand will create a ripple effect in the domestic economy.

This **ripple effect** arises when **industries benefiting from an increase in foreign demand increase their employment and purchases of goods and services from suppliers to meet the additional foreign demand, and in turn this increase in employment and production at suppliers will further boost employment and production in other industries.**

The multiplier³⁷ measures the overall impact on all industries of an increase in demand which in the first instance is directed towards a particular industry. The table below shows the impact on the key SME sectors of an increase of 10% in exports of all industries in the economy.

The first column in the Table 10 shows the share of exports in a particular economic sector. For example, manufacturing exports 16.4% of its value added while construction exports only 0.3% of its value added.

The second column in the table shows, for each economic sector, the increase in value added (in percentage terms) that results **directly and indirectly** from an increase of 10% in all the exports of the EU economy, and the third and fourth columns show the direct and indirect effect separately. .

For example, an increase of 10% in EU exports directly increases value added of the manufacturing sector by 1.6% and indirectly by 1.1%.

The indirect effect of increased exports benefits not only export-oriented firms in manufacturing but also firms which, while not exporting themselves, supply firms which do export or sell to users who benefit from the increase in aggregate income arising from higher exports. In other words, export stimulation benefits not only export-oriented firms but also indirectly more domestic demand facing firms.

While an increase in exports has no direct impact on the construction sector as the latter is almost entirely domestic demand facing, the indirect effect of higher exports increases slightly the construction sector's value added (by 0.2%).

Overall, the size of the EU economy, measured by value added, increases by 1.4% when total EU exports increase by 10%.

Finally, the fifth column shows the distribution across sectors of the EU-wide increase in value added. For example, manufacturing accounts for 46% of the total increase in value added while construction accounts for 1.3% of the total increase.

Table 10: Direct and indirect impact in key SME sectors of an increase in foreign demand, EU27, 2009

	Share of exports in sector's total output	Increase in output of sector as a % of sector's production (direct and indirect)	Direct effect	Indirect effect	Increase in output of sector as a % of total increase in output
Manufacturing	16.4%	2.7%	1.6%	1.1%	46.0%
Construction	0.3%	0.2%	0.0%	0.2%	1.3%
Retail and wholesale trade	6.9%	1.4%	0.7%	0.7%	9.6%
Business Services	6.8%	2.1%	0.7%	1.4%	8.7%
Accommodation/food Services	1.5%	0.4%	0.2%	0.2%	0.7%
Other sectors	3.5%	0.9%	0.3%	0.6%	34.5%
Total	6.8%	1.4%	0.7%	0.7%	100%

Source: Elaboration on Eurostat Input Output tables, EU27

3.2.5 Implications of analysis of internationalisation of SMEs

The clear policy implication of the analysis is that, while any measures to stimulate exports by SMEs may benefit only a limited number of SMEs, their increase in export activity will eventually benefit all SMEs, including those active in very low or low export-intensity industries.

However, the overall gains are more limited for the SMEs active in low-export industries than for the SMEs active in industries with a higher propensity to export.

3.3 High tech manufacturing and knowledge intensive service SMEs: drivers of innovation and growth?

KEY FINDINGS

- High tech and knowledge intensive SMEs are important contributors to a country's innovation capabilities and its future growth potential
- In the EU, only 2% of manufacturing SMEs are involved in high-tech
- About 30% of SMEs in the services industry are operating in knowledge intensive activities, and they generate more than a 1/3 of total value added produced by SMEs in services sectors
- Key factors for the development of High Tech manufacturing and Knowledge Intensive services:
 - investment in the renewal of operating capital, in particular: gross fixed capital formation and investment in technology intensive capital (information and communication technologies),
 - appropriate labour market policies
 - public investments in education and training

3.3.1.3

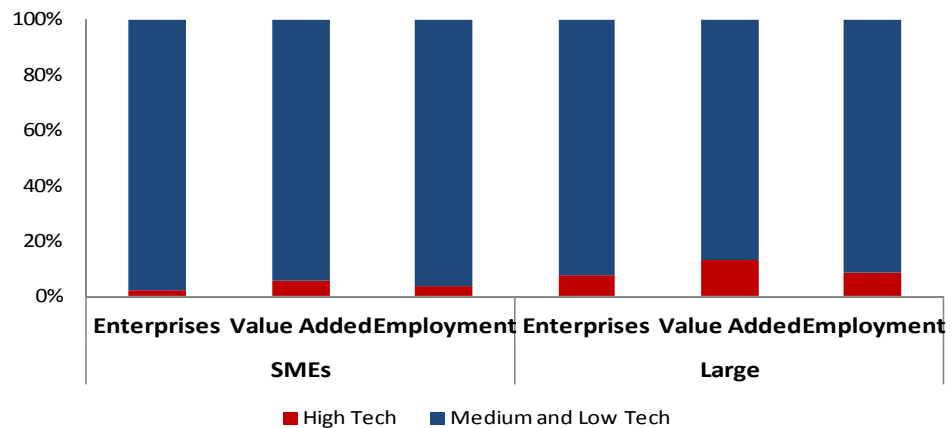

SMEs in high tech manufacturing and knowledge intensive services in 2013 in EU28

High tech and knowledge intensive SMEs are important contributors to a country's innovation capabilities and its future growth potential.

Overall, the high tech intensity of the EU28 manufacturing industry is relatively low, and this is true for both SMEs and large firms:

- In the EU28, in 2013, only 2% of manufacturing SMEs were involved in high-tech industries, and, in the case, of large firms the equivalent figure is 7%;
- However, the contribution of high-tech enterprises to value added generation is about twice as important. High tech SMEs generate roughly 6% of manufacturing value added while large high tech firms account for 13% of manufacturing value added;
- SMEs in high tech manufacturing sectors account for 4% of SME manufacturing employment.

Figure 48: Share (%) of high-tech on total manufacturing, SMEs and large enterprises, EU28, 2013

Source : Eurostat, National Statistical Offices and DIW Econ

In most EU28 Member States, high-tech manufacturing SMEs account for between less than 1% and 10% of manufacturing value added (annex XVI of the statistical background document).

However, in countries like Ireland and Malta, high tech SMEs play a particularly important role:

- in Ireland more than 30% of manufacturing value added is generated by high tech manufacturing SMEs; and,
- in Malta the comparable figure is 18%.

Figure 49: Share (%) of high tech manufacturing over total manufacturing, EU 28 SMEs, 2013

Source : Eurostat, National Statistical Offices and DIW Econ

About 30% of SMEs in the services industry are operating in knowledge intensive activities, and they generate more than a 1/3 of total value added produced by SMEs in services sectors.

Figure 50: Share (%) of knowledge intensive services on total services, SMEs and large enterprises, EU28, 2013

Source : Eurostat, National Statistical Offices and DIW Econ

SMEs in knowledge intensive services sectors are particularly prevalent in the United Kingdom and the Netherlands:

- at least 40% of services SMEs are active in knowledge intensive services sectors in the United Kingdom and the Netherlands; and,
- in the United Kingdom, knowledge intensive services SMEs generate almost half of the value added generated in the services industry.

Figure 51: Share (%) of knowledge intensive services over total services, EU 28 SMEs, 2013

Source : Eurostat, National Statistical Offices and DIW Econ

3.3.2 Performance of EU28 SMEs high tech manufacturing and knowledge intensive services from 2009 to 2012

Overall, over the period 2009-2012³⁸, the knowledge intensive SMEs are not performing any better than the non-knowledge intensive SMEs in the non-financial business sector in terms of real value added growth even if the degree of variation (indicated by the standard deviation statistics) is particularly higher in the case of knowledge intensive services SMEs.

On the other hand, high tech manufacturing SMEs have recorded an increase in real value added of 12% between 2009 and 2012 which contrasts with 7.8% increase in value added by the private, non-financial, business sectors and the 2% increase in real value added of the knowledge intensive service SMEs.

In terms of employment, the high-tech manufacturing SMEs performed rather poorly, with an overall decline of 6% whilst employment in the private, non-financial business sectors decline only by less than 1%. Noteworthy is the trend of employment in the knowledge intensive service SMEs, which, between 2009 and 2012 grew by over 7%.

Table 11: Descriptive statistics on EU28 high tech and knowledge intensive industries

	EU28 cumulative growth rate (2009-2012)	Mean cumulative growth rate of EU28 Member States (2009-2012)	Standard deviation of cumulative growth rate across EU28 Member States	Minimum cumulative growth rate shown by Member States	Maximum cumulative growth rate shown by Member States
SMEs in non-financial business sector

Source : elaboration on Eurostat, National Statistical Offices and DIW Econ

In 2009 and 2010, in terms of value added (at constant prices), the high-tech sector outperformed the private, non-financial business sectors until 2011, and larger

companies operating in the high-tech manufacturing sector have performed relatively better than the SMEs in the same sector.

Figure 52: High Tech manufacturing - Annual growth rate (in %) in value added in EU28 (2012-2008)

Note: Total B-N = the non-financial business sector.

Source : Eurostat, National Statistical Offices and DIW Econ

Knowledge-intensive services SMEs and larger firms experienced a much sharper decline in 2009 in value added (at constant prices) than non-knowledge services businesses.

However, subsequently, the knowledge-intensive firms (small and large) rebounded much more sharply in 2010 and to a lesser extent in 2010 than the non-financial business sector as a whole, and in 2012, the growth performance was broadly the same.

Figure 53: Knowledge Intensive Services - Annual growth rate (in %) in value added in EU28 (2012-2008)

Note: Total B-N = the non-financial business sector.

3.3.3 Statistical analysis

A simple econometric model was developed to identify the main drivers of growth in value added and employment of EU28 SMEs in the high-tech manufacturing and knowledge-intensive services sectors.

The variables to be explained by the econometric analysis are the cumulative growth from 2009 to 2011 in EU28 SME value added and employment in the in the high-tech manufacturing and knowledge-intensive services sectors. Key findings of the statistical analysis are reported below and the detailed empirical results are presented in the standalone working paper "High tech manufacturing and knowledge intensive service SMEs in Europe: Drivers of innovation and growth? -Working paper for the Annual Report of European SMEs 2013/2014".

High tech manufacturing

The main factors which are found to explain the cross- country variation in the cumulative growth in value added generated over the period 2009-2012 by SMEs in the high tech manufacturing sector in the EU28 are:

- the cost of continual vocational training courses as a percentage of total labour cost in 2010;
- the share of high tech manufacturing SME value added over total manufacturing value added;
- business expenditures in R&D across all sectors of the economy;
- the share of research and development personnel in the business sector as a percentage of the labour force.³⁹

Over the period of interest, growth in EU28 high tech manufacturing SME value added is linked to economies of scale in the high tech manufacturing sector.

The growth of the relative weight of EU28 high tech manufacturing SME value added over the total manufacturing is positively associated with the growth of High Tech manufacturing SMEs value added and statistically significant. This indicates that the sector is subject to economies of agglomeration.

Further evidence is provided by a review of the evolution of the number of high-tech manufacturing in relation to the number of other manufacturing enterprises in the economy. These data show that numbers of high tech manufacturing firms tended to grow even though the number of other manufacturing firms is decreasing in those countries where the ratio high tech manufacturing/total manufacturing is relatively higher.

Science and Technology factors such as increase in investments in business R&D and R&D personnel are also positively linked to increase in value added generated by high tech manufacturing SMEs. Both variables are statistically significant.

Knowledge-intensive services

Over the period 2009-2011, the statistical analysis reported in the Working Paper shows that the drivers of the growth in the value added of the knowledge-intensive industries in the EU28 are

- the growth of gross fixed capital formation;
- the value added of medium-high tech firms as a share of total manufacturing value added;
- labour market policies as represented by an overall index;
- total annual expenditure on public and private educational institutions per pupil in primary, secondary and tertiary education; and

- share of human resources in Science & Technology as percentage of the active population.

Investments in human resources and physical investments stimulate value added performance of SMEs in knowledge-intensive services. Both variables are statistically significant.

Labour market policies (including public expenditure on labour policies such as training, labour market services and subsidies) have also a beneficial effect on value added generated by SMEs in knowledge intensive services.

Moreover, public expenditure on education is also positively associated with growth of value added by SMEs in knowledge intensive services.

3.3.4 Implications of statistical findings

The performance of SMEs in EU28 high-tech manufacturing SMEs depends on a multiplicity of factors, all substantially related to the economy's effort in Science, Technology and Innovation.

In particular, real value added growth by SMEs in EU28 high tech manufacturing is linked to growth in R&D investments, both nationwide and sector specific, the growing availability of R&D personnel and the increase of technological investments especially in information and communication technologies.

Moreover, the increased attractiveness of the sector to young and skilled workers is a further element of superior performance.

The key conclusions emerging from the study of EU28 knowledge intensive services SMEs differs from that of the high-tech manufacturing SMEs in many aspects. Factors such as high educational attainments by the workforce are essential for a thriving SME sector in the knowledge intensive services.

Overall, the policy implications which emerge from the literature review and the statistical analysis pointing towards three main (complementary) directions:

- Investment in the renewal of operating capital, in particular: gross fixed capital formation and investment in technology intensive capital (information and communication technologies).
- Labour market policies
- Public investments in education and training

4 CONCLUSIONS

4.1 Key Findings

After promising signs last year, there are some reasons for cautious optimism - but the inescapable conclusion is that conditions remain extremely tough for SMEs and further support is needed to yield sustainable SME growth. While exports provide a much needed stimulus to many EU economies, most SMEs do not benefit in any major way directly from the growth in foreign demand for goods and services as they are active in industries which are mainly catering to the needs of domestic demand.

Across the EU28 last year, some 21.6 million SMEs in the non-financial business sector employed 88.8 million people and generated €3,666 trillion in value added. Expressed another way, 99 out of every 100 businesses in this sector are SMEs, as are 2 in every 3 employees and 58 cents in every euro of value added. This illustrates how critical SMEs are.

The financial crisis and the economic recession have hit SMEs hard in the EU28 and the economic conditions remain difficult. Overall, in the EU28 in 2013 the value added generated by SMEs was just 1% above 2008 levels and employment was still 2.6% below levels registered in 2008. This overall situation masks a great deal of heterogeneity as the performance of SMEs varies considerably among size classes, sectors and Member States:

- Micro SMEs suffered the biggest decline in total number and number of employees between 2008 and 2013 in the EU28
- In the construction and manufacturing sectors value added in 2013 is still below 2008 levels, while in the other key SME sectors (i.e. "professional, scientific and technical activities", "accommodation and food" and "wholesale and retail trade, repair of motor vehicles and motorcycles") EU28 value added is now above its 2008 level
- In 2013, the SMEs have exceeded their 2008 (pre-crisis) performance only in a limited number of Member States .

The triple divide of the SME performance among SME size class, sectors of activity and Member States suggests that a multi-pronged policy approach is required to support SMEs throughout Europe and support a sustainable recovery of the SME sector in the year ahead.

Depressed demand for the goods and services SME produce is the key factor explaining why SME performance has not yet recovered to pre-recession levels in a number of Member States. SMEs depend critically on improvements in overall macroeconomic conditions in these countries. Other key challenges influencing the performance of SMEs are found to be the difficulties in accessing to finance, finding customers, doing business, high costs of production and labour as well as the lack of skilled staff.

Looking ahead, the outlook is moderately positive with the promise of some strengthening of the recovery on the horizon. Total value added is expected to rise by 2.8% in 2014 and 3.4% in 2015. This would galvanise a virtuous cycle, with employment levels and the number of SMEs also returning to positive growth.

4.2 Conclusions and Policy recommendations

The results of this report clearly highlight the need for **SME size-classes and sectoral differentiation** in the design and implementation of new policies and regulations. Also, micro-SMEs and solo entrepreneurs should be treated differently. In the Member States where the SME sector has already surpassed its pre-recession levels, additional micro-SME targeted policies (e.g. fiscal exemptions, less regulatory requirements, etc.) could potentially contribute significantly to ensuring the sustainability of the sector's partial, yet fragile recovery.

In addition, it is important to take into account when developing SME policies that the majority of SMEs operate in sectors characterised by low export intensity and only a relatively small proportion of SMEs operate in high-tech manufacturing or knowledge-intensive services.

Government action must be taken to the next level to support the growth of European SMEs

In order to ensure sustainable SME growth and performance, the main challenges facing SMEs should be addressed effectively through the development and implementation of new and innovative policy solutions. For instance, even though a great deal of policy focus has been dedicated to improving **access to finance for SMEs** over the last couple of years, the SBA implementation assessment has shown that it is still a main barrier for SMEs. Thus, it is necessary to launch new solutions, such as the implementation of a "**Secondary Stock Exchange Market for the SMEs**", in addition to improving the efficiency of the existing financing schemes. This includes efforts to increase the market uptake of EU-based funding schemes via the EIB Group at the national level. This could be achieved through the increase in the number of financial intermediaries at the national level, the reduction of the administrative burden and the increase in the awareness of all existing support schemes among SMEs and financial intermediaries. In addition, SMEs should be guided and supported through the entire process of accessing finance via dedicated one-stop-shops where appropriate solutions according to their size, sector and purpose (e.g. for R&D, innovation, expansion, modernisation of manufacturing, implementation of energy efficiency solutions, internationalisation, digitisation, etc) are readily available and provided.

With regards to the other **main challenges** facing SMEs, such as the difficulty in finding customers, doing business, and the high costs of production and labour, this can not only be solved with SBA policies, but through the combination of horizontal and vertical policy formulations. For instance, the impact of technological advancements (e.g. ICT tools, digitalisation, cloud computing, smart software, Key Enabling Technologies - nanotechnology, micro- and nanoelectronics, biotechnology, photonics, advanced materials and manufacturing technologies) on the innovativeness, productivity, and profitability of SMEs cannot be neglected when designing new policies - especially at a time when we are going through a "Third Industrial Revolution" at a global scale. Particularly, ICT and digitalisation have a catalytic impact on the productivity and innovation of SMEs and offer many advantages to SMEs, as well as to public authorities for increasing the quality of the services that they offer to businesses and citizens. The main application areas for governments include e-Government, e-procurement, e-payments, e-signatures, e-commerce, e-Infrastructure for RD&I collaboration and learning, and e-business support services, which corresponds respectively to the SBA

principles of Responsive administration, Public Procurement, Entrepreneurship, Skills and Innovation, Internationalisation, and Single Market. With regards to e-Government, as indicated by the SBA implementation assessment, there is a need for increasing the interaction and sharing between different ministries and public authorities, in order to increase the efficiency of e-services provided and to further reduce administrative burden, particularly through the strict implementation of the “**submit-once**” principle.

In order to further boost the innovation capacity and capability of SMEs, which influences their export potential and competitiveness, user-centric **open innovation** as well service innovation in combination with technological innovation concepts should be supported by an appropriate policy and regulatory framework. This includes the consideration of the major role played by **clusters, living labs, design centres and innovation clinics**.

As additional support to innovation, **Innovative Public Procurement** solutions should also be supported and implemented at all levels. This requires the training of public procurers on the new procurement tools for effective implementation. By this way, the involvement of SMEs in public procurement can also be increased, while innovation, including eco-innovation, can be further supported, and market absorption of newly innovated goods and services can be accelerated via pre-commercial public procurement.

For combating the **skills gap within SMEs**, provision mechanisms should be put in place by national governments, where labour market needs should constantly be assessed and then reflected in the education and training systems. In addition, raising awareness among researchers on exploiting their RD&I results should be a priority from the onset of the RTD project. During the R&D and Innovation stages, strategic support should be provided for project risk analysis, exploitation strategy seminars, IP support, business plan development support and the organisation of brokerage events for SMEs to meet with investors and other potential collaborators for fund-raising and commercialisation of RD&I output.

While policies to support the **internationalisation** of SMEs and their growth in high-tech manufacturing or knowledge-intensive services are essential for the future economic well-being of Europe, the many SMEs operating outside these sectors should not be forgotten. There is a need for the establishment of a dedicated **umbrella organisation to support SMEs** on all aspects (e.g. financial and strategic support) of internationalisation, in order to increase efficiency by preventing the current overlaps and confusions between different organisations offering support.

Finally, the voice of SMEs should be taken into greater consideration through regular and effective consultations with SMEs and SME representatives. Moreover, **SME tests and regulatory impact assessments** should also be applied not on ad hoc basis but rather systematically as an integral part of policy making, which is currently still not the case in most of Member States.

Importance of SMEs to the economies of EU28 Member States

Within the EU, the bulk of SMEs and SME activity is concentrated in the largest Member States, as shown in the figures above. However, those figures alone are not an adequate measure of SMEs' importance to a particular Member State's economy, as they do not take into account the differing sizes of the various economies.

The perspective on the relative importance of the SME sector alters radically once such an adjustment for the size of each Member State economy is made.

In terms of the number of SMEs:

- Together with Greece, Central European countries such as Bulgaria, the Czech Republic, Slovakia, and Hungary have the highest "density" of SMEs, with 10

SMEs or more per million of value added generated in the non-financial business sector (refer to section IV of the statistical background document).

- Conversely, Germany, Luxembourg, Ireland and the United Kingdom have less than 5 SMEs per Million of Value Added produced in their respective business economies

In terms of the value generated by SMEs:

- In countries such as Ireland, Romania, and Poland, SMEs generate less than 50% of total value added of the non-financial business sector (refer to statistical background document).
- By contrast, in Cyprus, Estonia and Malta, the SMEs generate more than 70% of the total value added of the non-financial business sector.

In terms of employment by SMEs:

- Bulgaria, Romania, Lithuania and Latvia have the highest number of persons employed by SMEs per million of value added generated in the non-financial business sector (refer to statistical background document)

SMEs and large enterprises in the EU28 non-financial business sector

At the EU level, the relative importance of SMEs and large enterprises in the non-financial business sector is practically unchanged since 2008 (Figure 57).⁴⁰

Over the period 2008 - 2013:

The share of the number of SMEs in the total number of enterprises in the non-financial business sector has fluctuated between 99.79% and 99.8%;

The share of value added in the non-financial business sector generated by SMEs has fluctuated between 58.4% and 58.1%;

The SME employment share in total employment in the non-financial business sector ranged from 66.9% to 66.7%.

Figure 57: Number of enterprises, value added and employment in non-financial business sector - share of SMEs from 2008 to 2013 in EU28

Note: Slovakia is not included in this EU aggregate due to a break in the series.

Source: Eurostat, National Statistical Offices, DIW Econ

In contrast with the picture observed at the EU28 level, an analysis of the evolution of the shares in total SME value added, employment and number of enterprises of the different SME size classes shows much less stability (Annex II of the statistical background document).

- In particular, micro SMEs in Belgium, Bulgaria, Czech Republic, Estonia, Spain, Ireland, Lithuania, and Latvia, gained larger shares of the number of enterprises, value added produced and total employment of SMEs.
 - In the case of Belgium, Estonia, Lithuania and Latvia, the increase in the share of micro SMEs was mirrored by a decrease in the share of both small and medium firms.
 - In the case of Bulgaria, the increase in share of micro SMEs was accompanied by a decrease in the share of the number of small SMEs and a decrease in the value added and employment shares of the medium-sized SMEs.
 - In the Czech Republic, Ireland and Spain, the share gains of micro SMEs were accompanied by a fall in the share in the number, value added and employment of small SMEs and the employment share of medium-sized SMEs.
- Conversely, in Germany, Greece, Poland and Romania, the shares of small SMEs in total SME value added, employment and number of enterprises increased while generally the share of micro SMEs fell;
- Only in a limited number of cases (Austria, Croatia, Italy, for value added, and Cyprus, and the United Kingdom, for value added and employment) did the medium-sized SMEs increase their share;
- In all other countries, the shares of the different SME size classes remained broadly stable.

Additional information on the distribution of SMEs across sectors

In only two Member States (United Kingdom and Denmark) do the SMEs in the five key sectors account for the less than 75% but more than 60% of the SME population, value added and employment (Figure 1). In these countries, the administrative and support activities, real estate (specifically for Denmark), and information and communication services (particularly for the United Kingdom) account for the majority of the remaining shares.

Across Member States, the five key sectors above account for more than 65% of all SME enterprises, value added generated and SME employment in all Member States.⁴¹ Moreover, in six Member States – Italy, Czech Republic, Poland, Slovakia, Slovenia and Romania – that figure increases to 70% (Figure 1). However, in sharp contrast to the distribution of the number of SMEs across the three SME class sizes, the relative contribution of each size class to the generation of value added in the five economic

sectors is broadly identical across the three size classes (Figure 60, Annex V). But, the distribution of employment across the three SME size classes differs markedly from that of value added. The share of micro SME employment is about 7 percentage points higher than the share of micro SME value added while the opposite holds for medium-sized SMEs (Figure 61, Annex V).

The vast majority of firms (92.4%) in each of these five economic sectors are micro SMEs (Figure 59, Annex V).

The only exceptions are:

- Share of SME enterprise – the Netherlands, where business services have a slightly higher share;
- Share of SME value added – the Czech Republic, Italy and Slovenia, where the manufacturing SMEs produce a somewhat higher share of value added generated by SMEs in the non-financial business sector;
- Share of SME employment – the Czech Republic, Estonia and Slovenia, where the manufacturing SMEs' employment share of total SME employment is slightly higher.

Figure 58: Share of SME enterprises, value added and employment in non-financial business sector in Member States in EU28 Member States in 2013

Employment

Note: Five key sectors include "manufacturing", "construction", "accommodation and food services", "professional, scientific and technical activities", and "wholesale and retail trade, repair of motor vehicles and motorcycles". Data are ordered by the relative shares of number of enterprises in the wholesale and retail trade industry.

II. DISTRIBUTION AND PERFORMANCE OF SMEs BY SIZE CLASS, 2008-2013

The table below presents the detailed annual growth rate pattern of the following three performance indicators (number of enterprises, value added and employment) for SMEs and large enterprises in the EU28 non-financial business sector.

The data clearly show that, while the patterns of growth of SMEs and large enterprises may diverge slightly at times, the evolutions since 2008 of the two groups of enterprises show no systematic differences.

Table 12: Annual growth rate (in %) of number of enterprises, value added and employment by SMEs and large enterprises in the EU28 non-financial business sector - 2009 to 2013

		2009	2010	2011	2012	2013
Number of enterprises						
	SMEs	-1.35%	2.11%	0.64%	-0.35%	-0.89%
	Large	-3.46%	-1.00%	2.38%	-0.17%	-0.34%
	Total	-1.36%	2.11%	0.64%	-0.35%	-0.89%

Sector level analysis

In manufacturing and construction (Figure 64, Figure 65) for only a handful of countries there was growth in both employment and value added relative to 2008. However, France and the UK are no longer amongst these countries: SME manufacturing activity in France is expected to shrink by almost 15% while construction in the UK is anticipated to experience a similar decline among in terms of employment.

A strikingly large decline in activity of SMEs is expected in the construction sector in Greece (approximately 85% both for employment and value added). However, SMEs in construction in many larger economies are also expected to suffer (e.g. Spain, Portugal, Ireland, and Italy).

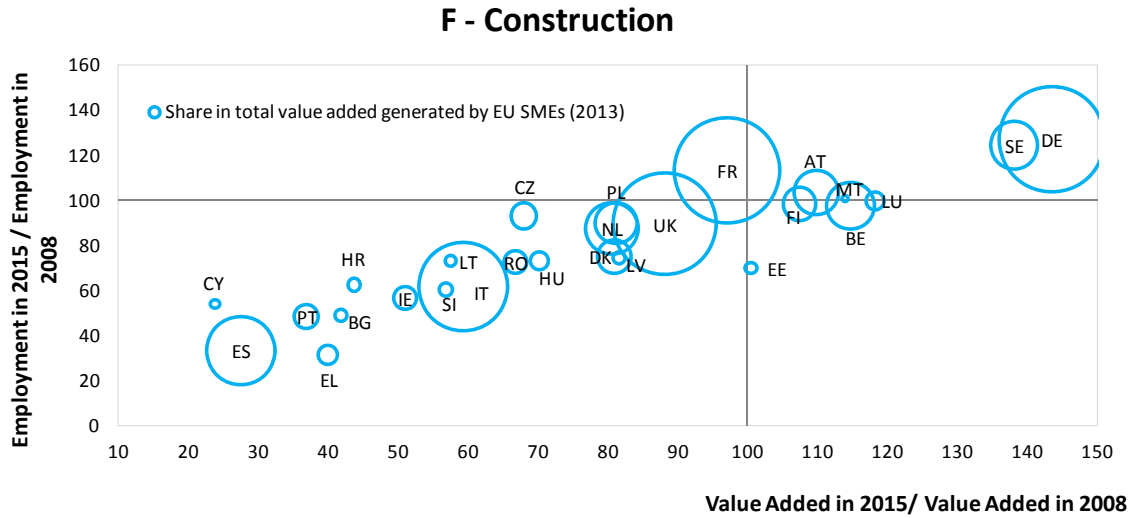

SMEs in wholesale and retail trade (Figure 66) are expected to grow significantly more in most countries, at least in terms of value added. For the other service sectors the picture is even more positive, across the board: value added generated by SMEs in professional, scientific and technical activity is expected to be higher than 2008 levels in all countries except Portugal, Italy and Croatia. For other services, employment will have recovered in all but four countries (Romania, Croatia, Ireland and Hungary).

Figure 64: Forecast SME value added and employment by Member State in 2015 (2008 = 100):
Manufacturing

Note: The size of bubbles reflects Member State's share in total value added generated by SMEs in the EU in 2013. Slovakia is omitted because of a structural break in the data. The location of the label is not related to the position of the country in the chart, which is represented by the center of the bubble.

XI. INTERNATIONALISATION OF SMES - SECTOR EXPORT INTENSITY LEVELS

Table 27: Classification of levels of export intensity - EU27

Export intensity	Classification
1	Very low (exports over total sales between 0 and 5%)
2	Low (exports over total sales between 5 and 10%)
3	Medium (exports over total sales between 10 and 20%)
4	High (exports over total sales between 20 and 40%)
5	Very high (exports over total sales above 40%)
-	Export not applicable/ no data available

Table 28: Sector labels

NACE abbreviation	sector	NACE abbreviation	sector
B	Mining and quarrying	G45	Wholesale and retail trade and repair services of motor vehicles and motorcycles
C10_C12	Food products, beverages and tobacco products	G46	Wholesale trade services, except of motor vehicles and motorcycles
C13_C15	Textiles, wearing apparel and leather products	G47	Retail trade services, except of motor vehicles and motorcycles
C16	Wood and of products of wood and cork, except furniture; articles of straw and plaiting materials	H49	Land transport services and transport services via pipelines
C17	Paper and paper products	H50	Water transport services
C18	Printing and recording services	H51	Air transport services
C19	Coke and refined petroleum products	H52	Warehousing and support services for transportation
C20	Chemicals and chemical products	H53	Postal and courier services
C21	Basic pharmaceutical products and pharmaceutical preparations	I	Accommodation and food services
C22	Rubber and plastics products	J58	Publishing services
C23	Other non-metallic mineral products	J59_J60	Motion picture, video and television programme production services, sound recording and music publishing; programming and broadcasting services
C24	Basic metals	J61	Telecommunications services
C25	Fabricated metal products, except machinery and equipment	J62_J63	Computer programming, consultancy and related services; information services
C26	Computer, electronic and optical products	L68	Real estate services (excluding imputed rent)
C27	Electrical equipment	M69_M70	Legal and accounting services; services of head offices; management consulting services

C28	Machinery and equipment n.e.c.	M71	Architectural and engineering services; technical testing and analysis services
C29	Motor vehicles, trailers and semi-trailers	M72	Scientific research and development services
C30	Other transport equipment	M73	Advertising and market research services
C31_C32	Furniture; other manufactured goods	M74_M75	Other professional, scientific and technical services; veterinary services
C33	Repair and installation services of machinery and equipment	N77	Rental and leasing services
D35	Electricity, gas, steam and air-conditioning	N78	Employment services
E36	Natural water; water treatment and supply services	N79	Travel agency, tour operator and other reservation services and related services
E37_E39	Sewerage; waste collection, treatment and disposal activities; materials recovery; remediation activities and other waste management services	N80_N82	Security and investigation services; services to buildings and landscape; office administrative, office support and other business support services
F	Constructions and construction works

--	-----

ENDNOTES

¹ The non-financial business sector includes the following industrial sectors: "mining and quarrying", "manufacturing", "electricity, gas, steam and air condition supply", "water supply, sewerage, waste management and remediation activities", "construction", "wholesale and retail trade, repair of motor vehicles and motorcycles", "transportation and storage", "accommodation and food services", "information and communication", "real estate activities", "professional, scientific and technical activities" and "administrative and support services". The industries not covered by the analysis include the following: "agriculture, forestry and fishing", "public administration and defence; compulsory social security", "education", "human health and social work activities", "arts, entertainment and recreation", "other service activities", "activities of households as employers; undifferentiated goods- and services-producing activities of households for own use" and "activities of extraterritorial organisations and bodies"

² Commission Recommendation of 6 May 2003 concerning the definition of micro, small and medium-sized enterprises, Official Journal of the European Union L124/36, 20 May 2003.

³ The Think Small First principle requires that legislation takes SMEs' interests into account at the very early stages of policy making in order to make legislation more SME friendly. A range of tools is available to ensure the effective implementation of the principle. These include the application of an SME test to forthcoming legislative proposals, the use of specific SME provisions in legislation in order to avoid disproportionate burden on SMEs, the consultation of the SME stakeholders, the work of the SME Envoy, the use of Common Commencement dates for legislation relevant for business etc.

⁴ Albania, Former Yugoslav Republic Of Macedonia, Iceland, Israel, Liechtenstein, Norway, Montenegro, Serbia and Turkey

⁵ Ideally, one would want to use value added at constant prices as a performance indicator. However, as Eurostat produces estimates of value added at constant prices only at the level of a whole industry and not for different enterprise size classes in an industry, the analysis focuses on value added at current prices. For information, section IV of the statistical background document provides information on the evolution of industry-wide value at current and constant prices.

⁶ See section V of the statistical background document for more detailed information on the share of the total economy and total employment accounted for by the non-financial business sector in the Member States.

⁷ Gross value added is the difference between output and intermediate consumption. As an aggregate measure of production, gross domestic product (GDP) is equal to the sum of the gross value added of all resident institutional units (i.e. economic sectors) engaged in production, plus any taxes and minus any subsidies, on products not included in the value of their outputs,

⁸ For convenience, we will also refer to the latter two sectors as "Trade" and "Business services"

⁹ See Section I of the statistical background information document for a year-by-year comparison of the growth rates of the number of enterprises, value added and employment of SMEs and large enterprises over the period 2008-2013.

10 As noted earlier in this report, this is mostly due to a break in the series in Slovakia statistics. Starting 2010, sole traders were included in the "micro" category.

16 World Economic Forum, The Europe 2020 Competitiveness Report : Building a More Competitive Europe, 2012 Edition

17 This project was delivered by a consortium composed of CARSA, PWC Luxembourg, Innova, London Economics, DIW, DIW Econ, and the University of Manchester. The present report was produced by London Economics, while the database (including now-casts for 2012-2013, and forecasts for 2014 and 2015) was generated by DIW Econ.

19 Greece, Spain, Ireland, Croatia, Italy, Slovenia, Hungary, Cyprus Portugal, Poland.

20 Due to scarcity of data, no detailed comparison can be presented with other trading partners such as China, as no data is available on SMEs for the three core indicators under scrutiny. For Russia, Brazil and India, there is scope for aggregate level analysis: for Russia, data is not available for sectors J, L, M, N and no statistics on large firms are observed. For Brazil, value added data lacks observation for sectors E, I, M, N. For India, only data for "All SMEs" size class is available, but only for enterprises and employment. Data for these countries will be however analysed in subsequent sections of this chapter.

21 Considered a "potential" candidate.

22 Of note is the fact that in both the USA and Japan, the SME classification differs from the standard adopted in the EU: medium firms can employ up to 299 employees, and thus large firms are those with more than 300. This impedes a one-to-one comparison of the enterprise demographics but the analysis is nonetheless relevant in the context of this report.

23 See statistical background document for detailed data.

24 Due to a structural break in 2009 in data for Japan, the analysis of time trends in the section will be carried out by indexing at 2009 rather than 2008.

25 Data on Indian SMEs is not provided by size class, and there is no data on large firms and on value added. Data on Russian SMEs is based on a different size classification, and also lacks data on large firms and on value added. Size class definitions for Russia: Micro (0-15), Small (16-100), Medium (101-250), Large (250+).

26 The analysis does not cover the year 2013 as yearly national accounts data for 2013 are not yet available.

27 First, the correlations between the different macro-economic indicators and the annual growth rate in the three SME performance indicators (number of enterprises, value added and employment) were estimated. The results of this analysis are presented in annex XV of the statistical background document.

Next, the contribution of developments in each intermediate and final demand component to the performance of SMEs were further assessed through econometric analysis, and the results are displayed in annex XV of the statistical background document. The model estimates a panel regression to explain the variation in growth of value added and employment of SMEs by sector, in the EU28. The regressors are the

components of demand (final consumption of households, final consumption of government, gross fixed capital formation, exports), all expressed in year-on-year growth rates from 2008 to 2013. An additional variable, the growth of value added in the total economy (all sectors and all size classes) is also included, as a proxy for the intermediate demand taking place along the value chain. The significant coefficients and R-squared for each regression are displayed in annex XV of the statistical background document.

28 The study's analysis and conclusions are based on a 2009 survey of 9,480 SMEs in 33 European countries.

29 Among recent publications, see for example: Lee H., Kelley D., Lee J., Lee S. (2012) "SME survival: The impact of internationalization, technology resources, and alliances", where internationalisation is shown to improve survival probability; Higon D.A., and Driffield N. (2011) show that exporting firms are also characterized by high levels of innovation activities, and that product innovation efforts significantly impact the probability of exporting.

30 BIS Economics Paper 13, p. 32. However, the percentage figure is similar to that for larger countries such as Germany and France. See House of Lords Select Committee on Small and Medium Sized Enterprises (2013). "Roads to Success: SME Exports". House of Lords Paper 131, p. 20, para. 2.7.

31 The cross-country analysis of SME export propensity in the case of goods exports can be performed combining COMEXT statistics on international trade (encompassing both intra- and extra- EU flows) and Structural Business Statistics. The statistics refer to the number of enterprises and include NACE sections B, C, D, E – Industry.

32 Data are from national statistical offices.

33 The database is a combination of National Statistical Offices data, Eurostat, and econometric estimates.

34 Input output tables for EU27 and a set of candidate countries are available at: http://epp.eurostat.ec.europa.eu/portal/page/portal/esag5_supply_use_input_tables/data/workbooks

35 Sectors are classified according to NACE Rev 2. Some industries/products are merged (e.g., there is no detailed 2-digit breakdown for sectors belonging to B, "Mining and quarrying").

36 See annex XI for a detailed breakdown of each sector by intensity level within a country.

³⁷ In this case, the multiplier is the output multiplier of Type I. This is obtained by deriving the Leontief inverse matrix from the Input Output table, and taking the column sums of the resulting matrix. This multiplier accounts for the direct and indirect effect of an increase in final demand on output. The direct impact is the one that producers immediately face, by expanding their production to meet the additional demand. This direct effect in turn determines an increase of the producers' demand on their suppliers, which is the indirect effect.

³⁸ Due to a lack of data for some of the potential drivers, the analysis is limited to the period 2009-2012.

39 This is the case of a variable on continued vocational training, which is available only for year 2010. See standalone working paper for more detailed information.

40 See Annex I of the statistical background document for a year-by-year comparison of the growth rates of the number of enterprises, value added and employment of SMEs and large enterprises over the period 2008-2013.

41 The statistical background document provides detailed information for all Member States on the distribution of the SME population, value added and employment across various sectors.
