Title: Therapeutic targets in the management of striae distensae: A systematic review

Article Type: Review

Keywords: striae distensae; striae rubrae; striae albae; stretch marks; therapy; treatment; management; systematic review.

Corresponding Author: Dr Ardeshir Bayat, MD PhD
Corresponding Author's Institution: University of Manchester

First Author: Adam Hague, MBChB, MRes

Order of Authors: Adam Hague, MBChB, MRes; Ardeshir Bayat, BSc, MBBS, MRCS, PhD

Abstract: Background: Striae distensae are permanent dermal lesions that can cause significant psychosocial distress. A detailed understanding of the numerous treatment modalities available is essential to ensuring optimal patient outcomes.

Objective: To evaluate and summarize the different treatment methods for striae distensae, by linking their proposed modes of action with the histopathogenesis of the condition, in order to guide patient management.

Methods: A systematic review of the literature was performed with no limits placed on publication date. Relevant studies were assigned a level of evidence by the authors.

Results: 92 articles were identified, with 74 being eligible for quality assessment. The majority of treatments aim to increase collagen production. The use of vascular lasers can reduce erythema in striae rubrae by targeting hemoglobin, whilst increasing melanin, through methods such as UV light, is a major focus for treatment of striae albae. Despite some topical treatments being widely used, uncertainty regarding their mode of action remains. No treatment has proven to be completely efficacious.

Limitations: Low quality evidence, small sample sizes, and varying treatment protocols and outcome measures limit our findings, along with concerns regarding publication bias.

Conclusions: Further randomized controlled trials are needed before definitive conclusions and recommendations can be made.
Dear Editor,

Thank you for accepting our systematic review for publication in JAAD, as well as providing us with suggestions for improvement regarding our tables. Please find below our response to these comments, along with a description of the changes that have subsequently been made in the revised manuscript and highlighted.

We look forward to hearing from you.

Yours sincerely,

Dr. Ardeshir Bayat
Editors comments

1. “JAAD is on a strict page budget. Tables 1, 2, and 3 are far too long to run in the print JAAD and can run online only and will be referenced with a link in the print JAAD. The online version of JAAD (which will contain all the tables) is the official archived version of the journal which is accessed by anyone doing a literature search (PubMed, etc.).

Please rename Tables 1, 2 and 3 as Supplementary Tables 1, 2 and 3 and make the same changes to their citations in the text.

Table IV (which will run the print JAAD) should be renamed Table 1; please make the same change to its citation in the text.” – Thank you for informing us of this. Tables I, II and III have been renamed as Supplemental Table II, III and IV respectively (Supplemental Table I outlining our quality rating scheme remains the same). Table IV has now been renamed Table I. Changes to their citations in the text have also been made.

2. “Regarding current Table IV, it seems that tretinoin fits into both categories, which is a bit awkward. Please insert a footnote explaining that different studies came to opposite conclusions.” - Thank you for this suggestion. Table I (previously Table IV) has now been amended accordingly.
Therapeutic targets in the management of striae distensae:

Capsule Summary

- Striae distensae are extremely common, permanent dermal lesions. There is great demand for an effective treatment option.
- The majority of treatments aim to increase collagen production, reduce erythema or increase pigmentation.
- Despite some positive outcomes, definitive recommendations cannot yet be made due to a lack of high quality evidence.
Abstract

Background: Striae distensae are permanent dermal lesions that can cause significant psychosocial distress. A detailed understanding of the numerous treatment modalities available is essential to ensuring optimal patient outcomes.

Objective: To evaluate and summarize the different treatment methods for striae distensae, by linking their proposed modes of action with the histopathogenesis of the condition, in order to guide patient management.

Methods: A systematic review of the literature was performed with no limits placed on publication date. Relevant studies were assigned a level of evidence by the authors.

Results: 92 articles were identified, with 74 being eligible for quality assessment. The majority of treatments aim to increase collagen production. The use of vascular lasers can reduce erythema in striae rubrae by targeting hemoglobin, whilst increasing melanin, through methods such as UV light, is a major focus for treatment of striae albae. Despite some topical treatments being widely used, uncertainty regarding their mode of action remains. No treatment has proven to be completely efficacious.

Limitations: Low quality evidence, small sample sizes, and varying treatment protocols and outcome measures limit our findings, along with concerns regarding publication bias.

Conclusions: Further randomized controlled trials are needed before definitive conclusions and recommendations can be made.
Keywords: striae distensae, striae rubrae, striae albae, stretch marks, therapy, treatment, management, systematic review.
Introduction

Striae distensae (SD), also known as stretch marks, are common, permanent dermal lesions that can be symptomatic, and are considered aesthetically undesirable. Thus, they pose a significant psychosocial and therapeutic challenge. They arise in areas of dermal stretching and most commonly occur on the abdomen, breasts, buttocks and thighs.\textsuperscript{1-3} Most literature has described SD during pregnancy (striae gravidarum) and puberty, with reported prevalences varying from 11-88\%\textsuperscript{1,2,4-7}. Hormonal influences,\textsuperscript{8-12} reduced genetic expression of fibronectin, collagen and elastin,\textsuperscript{13,14} along with mechanical stretching of the skin,\textsuperscript{2,15-17} have all been postulated to contribute to SD formation. In the acute phase, SD present as red/violaceous lesions (striae rubrae; SR) that can be raised and symptomatic.\textsuperscript{18} The chronic form (striae albae; SA) exists as hypopigmented dermal depressions.\textsuperscript{18,19}

Because of their high prevalence and impact on patients' quality of life,\textsuperscript{20} there is great demand for an effective treatment. A vast array of treatment modalities have been investigated, ranging from topicals\textsuperscript{19} and acid peel treatments,\textsuperscript{21} to more invasive methods such as laser therapy.\textsuperscript{22} Although completely eradicating SD is not attainable, improving appearance whilst reducing physical symptoms certainly is. It is therefore essential that clinicians managing SD have a detailed understanding of available treatment strategies in order to optimize patient outcomes and expectations.
We herein present a systematic review of SD focusing on the different treatments and their proposed modes of action with outcomes, in relation to the histopathogenesis of the condition.

**Methods**

Searches of both PubMed/Medline and Scopus were conducted using the keywords “stretch marks”, “striae distensae”, “striae rubra”, “striae alba”, “striae gravidarum”, AND “management”, OR “treatment”. No limits were placed on publication date, with the last literature search being conducted in November 2016. Citations of articles were also reviewed. Exclusion criteria consisted of animal/in vitro studies, non-English articles, unavailability of full text, book chapters, conference papers, letters, and reviews not specific to SD.

Data including treatment protocols, number of participants, and striae type were extracted. Relevant articles were assigned a level of evidence (LOE) independently by the authors based on a quality rating scheme modified from the Oxford Centre for Evidence-Based Medicine for ratings of individual studies (Supplemental Table I). The risk of bias was assessed for at both study and outcome level.

**Results**

92 articles of the 383 initially identified were included for analysis (Figure 1). 74 publications, representing 2328 patients, were relevant for quality
assessment and assigned a LOE, the results of which are as follows: level 1, 15 (20.3%); level 2, 31 (41.8%); level 4, 28 (37.8%).

Histopathogenesis

SD were first histologically described in 1889,23 with SR and SA being histologically distinct from one another (Figure 2).24-32 They exhibit abnormalities in three core components of skin which normally provide it with tensile strength and elasticity; collagen, elastin and fibrillin.25-29 Early changes associated with SR include accumulation of degranulating mast cells and macrophages around mid-dermal elastic fibers, resulting in elastolysis.24 These changes may be seen in macroscopically normal skin up to 3cm away from the lesion.24 As the striae progress to form SA, there is gradual epidermal atrophy with loss of rete ridges.24,25

Treatment

Enhanced collagen production (Supplemental Table II)

The vast majority of treatments are targeted towards stimulating collagen production (Figure 3).

Topical agents

Tretinoin (retinoic acid) is believed to increase tissue collagen I levels through stimulation of fibroblasts,19,33 and has also inhibited activation of matrix-degrading enzymes following ultraviolet (UV) induced skin damage, implying it may also protect the skin from other mechanisms of injury.19 Numerous studies, have investigated its efficacy (LOE 1,2,4),33,34-37 with the majority
suggesting that it can improve the appearance of early SD but not at lower doses. However, study populations were small and common side effects included transient erythema and scaling of the skin.\textsuperscript{19,33,34,36,37} Centella asiatica is a plant used in Asian herbal medicine. It contains asiaticoside which stimulates fibroblasts, with antagonistic effects on glucocorticoids also described.\textsuperscript{38} Its use in the prevention of striae gravidarum has been investigated, with reported reductions in the development and severity of striae (LOE 1).\textsuperscript{38} No side effects were observed. The use of Centella asiatica combined with boswellic acid, previously found to have anti-inflammatory effects, has also been tested.\textsuperscript{39} Reductions in striae severity were noted, however side effects included pruritus (LOE 4).

Hyaluronic acid is also thought to increase collagen production through stimulation of fibroblasts.\textsuperscript{40} Two RCTs (LOE 1) have reported improvements in the appearance of striae following its use, with a reported side effect being pain following treatment.\textsuperscript{40,41} No follow up was conducted and both incorporated subjective assessments into their outcome measures.

Chemical peel treatments

Chemical peel treatments involve the application of trichloroacetic acid (TCA) or glycolic acid (GCA). They are thought to induce an initial inflammatory response, with subsequent increased collagen production.\textsuperscript{21,42} A nonrandomized controlled trial investigating GCA reported decreases in striae furrow width, however concluded it may yield better results when used in
combination with other products.\textsuperscript{21} GCA combined with tretinoin and L-
ascorbic acid,\textsuperscript{43} and TCA combined with the use of sand abrasion\textsuperscript{42} or a
postpeel cream\textsuperscript{44} are such examples, all of which produced improvements in
the appearance of striae. No RCTs have been performed (GCA – LOE 2, TCA
– LOE 4) and postinflammatory hyperpigmentation (PIH) remains a
concern.\textsuperscript{42,44}

Mechanical techniques
Aluminum oxide microdermabrasion mechanically ablates damaged skin.\textsuperscript{45,46}
A study investigating its use in SD reported clinical improvements and
increased type 1 procollagen formation (LOE 2).\textsuperscript{46} Reported side effects
included PIH.

Radiofrequency (RF) devices
RF devices deliver RF current to the skin, which is converted to heat in the
dermis due to its electrical resistance.\textsuperscript{47,48} Following initial collagen
denaturation with its use, there is subsequent increased collagen
production.\textsuperscript{48} The majority of trials investigating RF for the treatment of SD
have reported clinical improvements (LOE 1,2,4).\textsuperscript{47-52} However, side effects
include erythema and edema,\textsuperscript{51,52} and the majority of trials had small
cohorts.\textsuperscript{49}

Fractional lasers
Fractional lasers deliver microscopic beams of coherent and monochromatic
light energy to the skin, creating areas of thermal damage termed
microthermal zones, leading to increased dermal collagen production.\textsuperscript{53-56} Both ablative and non-ablative lasers are available, with ablative lasers targeting water and resulting in cell vaporization.\textsuperscript{53} Improvements in SD following treatment with a 1540-nm fractional non-ablative erbium glass (Er:glass) laser have been reported (LOE 1,2,4).\textsuperscript{55-60} Malekzad et al\textsuperscript{61} however, observed only a fair or poor improvement in 70\% of patients with its use (LOE 4), and although improvements in SR have been described (LOE 4),\textsuperscript{62-64} the literature suggests that non-ablative lasers are most effective on SA (LOE 4).\textsuperscript{57} Concerns surrounding PIH also remain.\textsuperscript{18,57,61,63}

Fractional ablative CO\textsubscript{2} lasers have primarily been utilized in SA, with reported clinical improvements (LOE 2,4).\textsuperscript{65-69} Side effects include PIH. Gungor et al\textsuperscript{70} compared the efficacy of an ablative erbium-yttrium aluminum garnet (Er:YAG) laser with a non-ablative neodymium-doped yttrium aluminum garnet (Nd:YAG) laser and found poor clinical results with both (LOE 2). When compared to non-ablative lasers, the literature suggests ablative lasers are less well tolerated and produce inconsistent results.\textsuperscript{53}

\textit{Diode laser}

The 1450-nm diode laser is a non-fractional laser, which has been shown to increase dermal collagen.\textsuperscript{71} However, a RCT investigating its use in Fitzpatrick skin types IV-VI reported no improvements in SD, but high rates of PIH (LOE 1).\textsuperscript{71}
Intense pulsed light (IPL)

IPL consists of a broad-spectrum (515-1200-nm) visible beam of high intensity light. Studies investigating its use in SD have demonstrated increased dermal collagen levels following treatment (LOE 4). However, a study comparing IPL against a fractional CO₂ laser for the treatment of SD, concluded that the laser was more effective (LOE 2). No RCTs have yet been performed and PIH remains a cause for concern.

Percutaneous collagen induction therapy (PCT)

PCT, or needling therapy, involves the creation of micro-clefts extending to the papillary dermis, resulting in increased production of collagen and elastin. Aust et al reported improvements in skin texture and tightening following treatment (LOE 4). More recently, PCT compared favorably against microdermabrasion combined with sonophoresis, and a CO₂ laser (LOE 2). However, there are no RCTs, and side effects include erythema.

Platelet-rich plasma (PRP)

PRP is a concentrated solution of autologous platelets containing growth factors and cytokines injected intradermally. Ibrahim et al investigated its use in SD with microdermabrasion, and despite increased collagen levels following PRP treatment alone, 13% developed worsening of their striae (LOE 2). They concluded it is best to use PRP in combination with microdermabrasion. Other studies have combined PRP with RF (LOE 4) and microneedling (LOE 2), all reporting varying degrees of clinical...
improvement. However, small sample sizes and no RCTs make drawing definitive conclusions difficult. Side effects include bruising.\textsuperscript{45,80}

\textit{Infrared light}

Infrared light applied to skin causes heating of the dermis and collagen denaturation, with subsequent neocollagenesis.\textsuperscript{83} Trelles et al\textsuperscript{83} investigated its use in the treatment of SA. Despite positive histological findings, including more pronounced rete processes, detection of improvements clinically remained low (LOE 4). Side effects were limited to erythema of the skin.

\textit{Galvanopuncture}

Galvanopuncture is a needling therapy which applies a continuous microcurrent, inducing an inflammatory reaction with subsequent collagen production.\textsuperscript{84} Bitencourt et al\textsuperscript{84} investigated its use in SA. All patients demonstrated clinical improvements and erythema was the only side effect (LOE 4). Further trials, with histological analysis, are needed to further assess its efficacy.

\textbf{Reduced vascularity (Supplemental Table III)}

\textit{Vascular lasers}

The 585-nm pulsed dye laser (PDL) is a commonly used vascular laser. Due to its high affinity for hemoglobin, which is present in the microvasculature of SR, it can reduce the erythema of these lesions (LOE 2).\textsuperscript{85} Although improvements in both collagen\textsuperscript{85,86} and elastin\textsuperscript{87} been described following PDL treatment, these are probably subclinical and PDL is likely to have minimal
benefit in the treatment of SA (LOE 2,4).\textsuperscript{86,88,89} Care should be taken when using PDL with darker skin types (Fitzpatrick IV to VI), as melanin competes with hemoglobin for the light energy, which can result in PIH.\textsuperscript{85,90} Longo et al\textsuperscript{91} tested the 577-nm copper bromide laser, which has higher rates of absorption by hemoglobin than its PDL counterpart. 33\% had complete resolution of their SD with the remainder showing a reduction in striae size (LOE 4). Crusting of the skin was a reported side effect. The Nd:YAG vascular laser has also produced clinical improvements in SR (LOE 2,4), however side effects include PIH.\textsuperscript{25,60}

Increased melanin (Supplemental Table IV)

UV light

A major aim for the treatment of SA is repigmentation of the lesion. Sadick et al\textsuperscript{92} investigated the combined use of UVB (296-315-nm) and UVA1 (360-370-nm) light in nine individuals. Despite all patients initially having >50\% improvement in pigmentation, this was only temporary and side effects included transient hyperpigmentation (LOE 2).

Excimer laser

The xenon chloride (XeCl) excimer laser delivers narrow band (308-nm) UVB radiation.\textsuperscript{93} Its proposed advantages include being able to deliver the radiation quicker with increased precision when compared with standard UV therapy.\textsuperscript{93} Studies have reported improvements in striae pigmentation following its use (LOE 1,4).\textsuperscript{93,94} However, poor results were observed elsewhere (LOE 2)\textsuperscript{95} and
splaying of the pigment to involve surrounding skin is a reported side effect.93,95

A study investigating UVB light therapy and the XeCl excimer laser found that both cause hypertrophy and increase of melanocytes, along with an increase in melanin, albeit not permanent.96

Other (Supplemental Table IV)

Bio-Oil® (Union Swiss Ltd, South Africa) consists of vitamins and plant extracts with an oil base.97 One study investigating its use in SD demonstrated visual improvements after two weeks (LOE 2).98 No side effects were reported.

Cocoa butter is a natural fat, and used as a topical formulation to rehydrate the skin.99 Two trials have investigated its use in preventing SD (LOE 1).100,101 Both failed to show any significant benefits with its use.

Soltanipoor et al102 and Taavoni et al103 hypothesized that, because of its high vitamin E content and moisturizing properties, olive oil could have a role in preventing striae gravidarum. However, no benefits with its use were reported (LOE 1).

Taşhan et al104 studied the use of almond oil alone and with massage in preventing striae gravidarum formation, and observed fewest striae in those applying almond oil with massage (LOE 2). However, a RCT comparing the
effects of an Iranian produced cream (Saj®, Seoidrood Co, Iran), containing almond oil, against olive oil, found neither were effective at reducing severity of striae gravidarum (LOE 1). No side effects were reported in either trial.

Silicone gel has previously been used to improve scars, with promoting skin hydration being one proposed mode of action. Ud-din et al investigated the effect of silicone against a placebo on SD. They demonstrated increased melanin and decreases in hemoglobin and collagen with both gels. They concluded that the application of gels by topical massage can improve SD (LOE 1). No side effects were reported.

Discussions

Discussion

SD are common yet undesirable permanent dermal lesions. Despite a basic understanding of the etiology and histopathological changes that occur, finding an effective treatment is proving challenging. The majority of treatment modalities are targeted towards increasing collagen production. Topical treatments in this category still lack consistent high quality evidence, with the effects of massage potentially influencing the findings. Tretinoin has had variable outcomes, with its efficacy mostly demonstrated for the treatment of SR, and despite both Centella asiatica and hyaluronic acid yielding promising results (Table I), uncertainty regarding the type of striae they are most effective against remains. Chemical peel treatments, microdermabrasion, PRP and PCT also lack high quality evidence, with no RCTs having yet been performed. Emerging techniques such as galvanopuncture look promising, however knowledge regarding its mode of action specific to SD is lacking,
along with evidenced-based trials. Lasers have been used in attempts to increase collagen production, reduce erythema in SR, and increase pigmentation in SA. Accurately interpreting these studies is difficult, owing to the small sample sizes used and short follow up periods. UV light has shown promise for the repigmentation of SA, although its lack of permanency means repeated sessions would be needed. Numerous other topicals, which mostly claim to hold moisturizing properties, are widely marketed despite lack of evidence regarding their mode of action or efficacy.

Limitations
Exclusion criteria used may have resulted in relevant studies being missed, if for example they were not published in the English language. Of those included making direct comparisons is extremely difficult, even for those using the same treatment modality, due to widely varying treatment protocols and differences in study populations. This is compounded by the different outcome measures utilized, of which none are yet validated. A large proportion assessed for improvements through the use of clinical photographs, with differences in lighting potentially influencing results. Patient satisfaction scores were also widely used, however one may question whether scores would change if the treatments were not free/provided outside the trial setting. Small sample sizes and limited follow up periods are also major limitations in a large proportion of studies. Concerns surrounding publication bias also remain, as the vast majority of papers reported some positive results.
Conclusion

Further RCTs are needed before definitive conclusions and recommendations can be made. Future work should focus on creating standardized outcome measures and treatment protocols in order to enable accurate comparisons between treatments.

Figure 3: Treatments for SD and the highest LOE available for their use.

The majority of treatments are targeted towards enhancing collagen production. A large proportion of the RCTs conducted have been with topical agents, producing varying results. (LOE – level of evidence, TCA - trichloroacetic acid, GCA – glycolic acid, RF – radiofrequency, IPL – intense pulsed light, PCT – percutaneous collagen induction therapy, PRP – platelet-rich plasma, PDL – pulsed dye laser, Nd:YAG - neodymium-doped yttrium aluminum garnet, UV – ultraviolet, XeCl – xenon chloride).
Normal Skin

- Visible downward epidermal projections (rete ridges)
- Thin, randomly arranged collagen and elastin fibers in the papillary dermis
- Thick collagen bundles predominate in the reticular dermis

Striae Rubrae

- Predominance of fine dermal elastic fibers with evidence of structural changes in collagen
- Dermal edema
- Increased microvasculature contributing to their erythematous color

Striae Albae

- Epidermal atrophy with loss of rete ridges
- Densely packed collagen fibers aligned parallel to dermal-epidermal junction
- Elastic fibers arranged in a similar pattern to those of collagen
- Reduced microvasculature resulting in their pale color
Treatment of striae distensae

### Histological Analysis

Clinical improvements in 90% of PCT treated group vs. 50% in microdermabrasion + sonophoresis treated group

Significantly higher satisfaction scores with PCT

Epidermal thickness, number of fibroblasts and collagen levels were increased in 90% and 50% of the PCT and microdermabrasion + sonophoresis treated groups respectively

**Erythema PIH** (more common in microdermabrasion + sonophoresis group)

---

### Clinical Improvement

Clinical improvements in 90% of PCT treated group vs. 50% in laser

**Erythema PIH** (more common in fractional ablative CO₂)

---

### Patient Satisfaction

- **Nassar et al**
  - **PCT vs. microdermabrasion + sonophoresis**
    - **PCT - 3 sessions with 4 week intervals**
    - **Microdermabrasion - 10 sessions over 5 months**
    - Clinical improvement: no improvement, mild (≤25%), moderate (26-50%), good (51-75%), excellent (≥76%)
    - Patient satisfaction: not satisfied, slightly satisfied, satisfied, very satisfied, extremely satisfied
    - Histological analysis minimal (<25%), moderate (26-50%), marked (51-75%), excellent (76-100%)
    - Patient satisfaction: unsatisfied, somewhat satisfied, highly satisfied

- **Khater et al**
  - **PCT vs. fractional ablative CO₂**
    - **PCT - 3 sessions with 4 week**
    - **SR and SA**
    - Clinical improvement: none, mild (≤25%),
    - Clinical improvements in 90% of PCT treated group vs. 50% in laser
    - Erythema PIH (more common in fractional ablative CO₂)

REQUIRED SUBMISSION FORM AND CHECKLIST FOR AUTHORS

(Photocopy this page, complete all applicable sections, and submit with manuscript)

Corresponding Author:  Ardersir Bayat

Phone No.: +44(0)161 3060607 Fax No.: _____________ E-mail: ardershir.bayat@manchester.ac.uk

☑ Cover letter:
  ☑ Title, brief description of manuscript and its significance to dermatologists
  ☐ Suggested section
  ☐ Explanation of any conflicts of interest
  ☐ Possible reviewers

☑ Title page (in word document format only)
  ☑ Title of article
  ☑ Full name(s), academic degrees, and academic, institutional, and relevant corporate affiliations of author(s)

  All writers and contributors who participated in the preparation of the manuscript are listed as authors, (see Authorship Statement form)
  ☑ Name, address, business telephone and fax numbers, and E-mail address of author to whom correspondence should be sent.

☒ Statement of all funding sources for the work. If none, please state: This article has no funding source.

☐ Publishable disclosure statement of potential conflicts of interest for each author. If none, please state: The authors have no conflict of interest to declare

 ☐ Statement on any prior presentation

 ☐ Reprint request line

 ☑ Text word count, number of references, tables, and figures

☑ Manuscript document (in word document format only)
  ☑ Manuscript is double-spaced with each section beginning on a new page
  ☑ Number the pages in the upper-right corner
  ☑ Abstract (structured, if required) begins the manuscript submission
  ☑ Submission has continuous line-numbering
  ☑ Abbreviation and acronym list, starting on a separate page
  ☑ References (double-spaced), starting on a separate page
  ☑ Figure legend (double-spaced), starting on a separate page

☑ Tables, each uploaded as a separate file (in word document format only)

☐ Figures, each uploaded as a separate file (in .jpg, .tif, or .eps format only) and are a minimum of 300 dpi

☐ Signed Copyright Transfer Statement with signature from each author (online submission only)

☐ Signed from each author (online submission only)

☐ Signed Conflict of Interest Statement from each author (online submission only)

☐ All human and animal studies are approved by an Institutional Review Board
  ☐ Copy of Institutional Review Board approval for clinical research trials (online submission only)

☐ CONSORT checklist for randomized trials (online submission only)

☐ Patient consent letters (photographic and informed consent, online submission only)

☐ Permission to reproduce material published previously (online submission only)

☐ Contents of the manuscript have not been previously published and are not currently submitted elsewhere

☐ I accept responsibility for the scientific integrity of the work described in this manuscript

☐ All listed authors have seen and approved of the manuscript and will sign off on any subsequent manuscript revisions

Signature of corresponding author who verifies that above is correct ______________________________ Date __________
AUTHORSHIP DECLARATION

Each author must fill out a separate copy of this form.

All persons and only persons who meet authorship criteria should be listed as authors. Criteria for authorship include having performed at least one of the tasks listed in boxes #1-6 below and having read and approved the final version of the paper. All authors certify that they have participated sufficiently in the work to take public responsibility for the content, including participation in the concept, design, analysis, writing, and/or revision of the manuscript. Furthermore, each author certifies that this material or similar material has not been and will not be submitted to or published in any other publication before its appearance in the Journal of the American Academy of Dermatology. If this study has been or will be presented at a national meeting, indicate the appropriate information on the title page.

Acknowledgment: All persons who have made substantial contributions to the work reported in the manuscript, including but not limited to generating data, performing statistical analysis, and/or substantial editing that affects the content of the paper, but whose contribution is not sufficient to warrant inclusion as an author, should be listed in the Acknowledgment along with their affiliation(s) and funding source(s), if any, and have given the Journal permission to be named. If I (we) do not include an acknowledgment, that means I (we) have not received substantial contributions from nonauthors.

The author’s name must be typed or clearly printed beneath the signature. Each author must indicate which of the following aspects of the work he or she participated in by checking the box(es) that apply. (It is not necessary for each author to check each of the boxes.) At least one of boxes 1-6 below must be applicable and checked by each author. Box number 9 must also be applicable to each author and must be checked.

☐ 1. I participated in designing the study.
☐ 2. I participated in generating the data for the study.
☐ 3. I participated in gathering the data for the study.
☐ 4. I participated in the analysis of the data.
☐ 5. I wrote the majority of the original draft of the paper.
☐ 6. I participated in writing the paper.
☐ 7. I have had access to all of the raw data of the study.
☐ 8. I have reviewed the pertinent raw data on which the results and conclusions of this study are based. MANDATORY FOR FIRST OR SENIOR AUTHOR.
☐ 9. I have approved the final version of this paper. MANDATORY FOR EACH AUTHOR.
☐ 10. I guarantee that all individuals who meet the Journal’s authorship criteria are included as authors of this paper. MANDATORY FOR CORRESPONDING AUTHOR.
☐ 11. The name(s) and affiliation(s) of the individual(s) who performed the statistical analyses of this work are listed here. (To be filled in by corresponding author.)

Journal of the American Academy of Dermatology
Disclosure Statement of Potential Conflict of Interest

I, __________________________________ , attest that I have submitted for consideration for possible publication in the Journal of the American Academy of Dermatology (JAAD) a manuscript entitled:

Therapeutic targets in the management of striae distensae: A systematic review

I hereby certify that, to the best of my knowledge, (1) the work that is reported on in said manuscript has not received financial support from any pharmaceutical company or other commercial interest except as described below, and (2) neither I nor any first-degree relative has any special financial interest in the subject matter discussed in said manuscript, except as described below. (I understand that an example of one type of such special financial interest would be ownership, by me or a first-degree relative, of a company that sells a product relating to the subject matter of the manuscript.)

Describe any exceptions. Use additional page(s) if space below is insufficient.

Commercial Interest: A commercial interest, as defined by the ACCME, is any entity producing, marketing, reselling, or distributing health care goods or services consumed by, or used on, patients. The ACCME does not consider providers of clinical service directly to patients to be commercial interests. A commercial interest is not eligible for ACCME accreditation.

A first-degree relative is defined as a spouse, parents, brothers, sisters, or children of the member.
Disclosure Steps:

A. List the names of commercial interest producing health care goods or services with the exception of non-profit or government organizations and non-health care related companies with which you or your spouse/partner have a financial relationship.

B. Identify the type of ownership interest or compensation you or your first-degree relative\(^2\) received (ex: salary, honorarium, etc.). The Academy does not need to know the dollar amount.

C. Identify the role you or your first-degree relative have with the commercial interest.

D. If you or your first-degree relative have received multiple items from the same commercial interest or if you or your first-degree relative have had more than one role for the same commercial interest, enter a separate record for each role/item received.

If you have NO financial relationship(s) to disclose:

- Neither I, the undersigned, nor a first-degree relative, has financial interests/arrangements, affiliations, or other relationships with the commercial supporter(s) of this activity or with any other organization(s) that provide(s) products or services that are relevant to the content for which I am responsible.

If you DO have financial relationship(s) to disclose:

- I, the undersigned, and/or my first-degree relative currently has a financial interest/arrangement, affiliations, or other relationships with the commercial supporter(s) of this activity or with another organization(s) that provide(s) products or services that are relevant to the content for which I am responsible.

**NATURE OF FINANCIAL COMPENSATION**

1 Select from the following the role for which you received financial compensation from a commercial interest:

- Advisory Board
- Board of Directors
- Consultant
- Employee
- Founder
- Independent Contractor
- Principal Investigator
- Speaker
- Speaker/Faculty education
- Stockholder
- Other: please specify:_____________________

\(^2\) A first-degree relative is defined as a spouse, parents, brothers, sisters, or children of the member.

JAAD Disclosure Statement of Potential Conflict of Interest
2. Select the type of compensation received:

- Equipment
- Fees
- Grants/Research Funding
- Honoraria
- Non-accredited CME Educational Grant
- Patent royalties or other compensation for Intellectual Property Rights
- Residency/Fellowship Program Funding
- Salary
- Stock
- Stock Option
- No Compensation Received
- Other Financial Benefit: please specify: ____________________

I agree to update this form within 30 days after I establish any new financial relationships that could represent potential conflicts of interest.

I agree to update this form within 30 days after I establish any new financial relationships that could represent potential conflicts of interest.

3 This means compensation that your institution received for your efforts on this study.
Under Commercial Interest Relationships, did you list a relationship as “Other” under the “For What Role” column or “Other Financial Benefit” under “Compensation”? If yes, please describe the relationship. Please also provide additional details about any relationship documented above or that does not meet the designated categories that requires disclosure under the AAD’s Administrative Regulations or merits further explanation.
